UNIT 1 Conception to Birth

Unit Overview	xx
---------------	----

1. New Calculator Factors Chances for Very Premature Infants,
Denise Grady, *The New York Times*, April 17, 2008

Researchers have developed a **statistical tool** to determine the chance of a **premature** baby's **survival** and the likelihood of **birth defects**. Gender and birth weight are key factors in helping babies born as early as 22 to 25 weeks survive. The calculations influence **medical decisions** that are to be taken for the care of these premature infants.

2

2. Genes in Context: Gene–Environment Interplay and the Origins of Individual Differences in Behavior, Frances A. Champagne and Rahia Mashoodh, *Current Directions in Psychological Science*, June 2009

The old-fashioned **nature-nurture debate** is giving way to more sophisticated approaches, such as **epigenetics**, to unravel how genes and experience interact to shape development. Environment can determine which **genes** can “turn on” or stay silent.

4

3. Effects of Prenatal Social Stress on Offspring Development: Pathology or Adaptation?, Sylvia Kaiser and Norbert Sachser, *Current Directions in Psychological Science*, April 2009

This article describes how **prenatal stress** can affect development in humans and animals. Social instability and stress can cause **hormonal changes** for the fetus that may lead to **masculinized effects** in daughters and decreased masculinization in sons.

8

UNIT 2 Cognition, Language, and Learning

Unit Overview	12
---------------	----

Part A. Early Cognition and Physical Development

4. Infants' Differential Processing of Female and Male Faces, Jennifer L. Ramsey-Rennels and Judith H. Langlois, *Current Directions in Psychological Science*, April 2006

This article about **infants' processing of faces** discusses infants' difficulty in forming a male prototype and also the fact that infants **preferred female faces** to male faces. This is explained in terms of **environmental experiences** with female faces and **evolutionary dispositions**.

14

5. **The Other-Race Effect Develops during Infancy: Evidence of Perceptual Narrowing**, David J. Kelly et al., *Psychological Science*, December 2007
 Additional support for **environmental influences** on **face processing** is presented in this article. **Infants** learn to discriminate faces in their own race from other races by 9 months of age, a form of “**perceptual narrowing**” that may facilitate the development of the **other-race effect** seen in adults. 18
6. **New Advances in Understanding Sensitive Periods in Brain Development**, Michael S. C. Thomas and Mark H. Johnson, *Current Directions in Psychological Science*, January 2008
 The human brain is marked by **plasticity** early in life but also is susceptible to the power of experiences at different ages. **Sensitive periods** occur when the brain seems optimally prepared to learn certain skills and knowledge, such as **imprinting** and **attachment** and even **second languages**. 24
7. **Contributions of Neuroscience to Our Understanding of Cognitive Development**, Adele Diamond and Dima Amso, *Current Directions in Psychological Science*, February 2008
 Neuroscience has shown that **biology is not destiny**—that experience affects the growing brain. Authors Diamond and Amso describe recent neuroscience research in several areas, including **infant imitation and mirror neurons**, **neurotransmitters**, **maternal touch** and **infant stress**, and the **intergenerational transmission of biological and behavioral characteristics**. 28
8. **It’s Fun, but Does It Make You Smarter?**, Erika Packard, *APA Monitor on Psychology*, November 2007
 Children’s **Internet usage** has increased greatly in recent years, but how does it **affect their learning**? Research suggests that because of the heavy text-based material online, Internet usage may improve children’s **reading performance**. Children need to learn skills that are necessary for **self-directed** online learning for it to be productive. 33
9. **Language and Children’s Understanding of Mental States**, Paul L. Harris, Marc de Rosnay, and Francisco Pons, *Current Directions in Psychological Science*, February 2005
 Normal children develop a **theory of mind**—they learn to understand other people’s feelings and points of view. The scientists discuss research on the crucial role of **maternal conversation and language interventions** to promote children’s understanding of mental states. 35
10. **Developmental Narratives of the Experiencing Child**, Katherine Nelson, *Child Development Perspectives*, vol. 4, no. 1, March 11, 2010
 In contrast to most theories that analyze the child as an object, this paper describes childhood development by emphasizing **the child’s personal experiential perspective**. The child’s **meaning** of life is shaped by **language, memory, and shared experience** in different contexts of **interactive encounters**. 39
11. **Social Cognitive Development: A New Look**, Kristina R. Olson and Carol S. Dweck, *Child Development Perspectives*, April 2009
 The field of **social cognitive development** uses methods to study how children’s thinking about other people and social relationships develops. This research is illuminating **how children think about people’s good and bad actions** and **understand people who are similar or different**. 44
12. **Future Thinking in Young Children**, Cristina M. Atance, *Current Directions in Psychological Science*, April 2008
 The ability to “**mentally time travel**” may be uniquely human, but when can children mentally project themselves into the future? Using experimental evidence, Atance shows that this skill emerges during the **preschool years** and may be involved in **planning future behaviors** and **delaying gratification**. 49

13. **Talking about Science in Museums**, Catherine A. Haden, *Child Development Perspectives*, vol. 4, no.1, March 2010
Parent-child conversation is a major influence on children’s development. This article examines such communication, specifically about science topics, in an interesting setting: museums. Children’s knowledge is enhanced by parents’ use of **elaborative conversation** with many questions and expansions on children’s comments. 53

Part B. Learning in School

14. **When Should a Kid Start Kindergarten?**, Elizabeth Weil, *The New York Times Magazine*, June 3, 2007
This article presents **multiple perspectives** on when a child should begin school. The phenomenon of **“redshirting,”** or opting to hold a child back, is explored, especially in terms of **academic achievement. School readiness and family dynamics** are also discussed. 59

15. **Should Learning Be Its Own Reward?**, Daniel T. Willingham, *American Educator*, Winter 2007–2008
The author uses recent initiatives by several schools in several states to pay students for performance on **high-stakes standardized tests** as a way to examine the use of and impact of rewards on student learning. He summarizes the arguments against the use of rewards into three categories and then suggests ways teachers can appropriately use rewards while avoiding their potentially detrimental effects. 64

16. **Social Awareness + Emotional Skills = Successful Kids**, Tori DeAngelis, *APA Monitor on Psychology*, April 2010
Although schools have emphasized academic intelligence, evidence is mounting to show that **emotional intelligence** matters, too. This article reviews research confirming that children who complete a social and emotional learning program score significantly higher on **achievement tests** and appear **healthier on depression and anxiety**. 70

UNIT 3 Social and Emotional Development

Unit Overview 72

Part A. The Child’s Feelings: Emotional Development

17. **A Neurobiological Perspective on Early Human Deprivation**, Charles A. Nelson, *Child Development Perspectives*, January 2007
Many children worldwide are raised in **institutional settings**, which have been shown to have **deleterious effects on development**. Early institutionalization **causes reduced cortical activity in the brain** and a disturbed **neuroendocrine system** that regulates social behavior. These findings help explain how institutional care leads to **developmental problems**. 74

18. **Don’t!: The Secret of Self-Control**, Jonah Lehrer, *The New Yorker*, May 18, 2009
Learning how to **control one’s emotions, desires, and actions** is a crucial task of early childhood. The article describes fascinating research that tests when such skills develop, how they are related to **children’s behavior and brain maturity**, and how self-control matters for **long-term development**. 79

19. **Children’s Capacity to Develop Resiliency: How to Nurture It**, Deirdre Breslin, *Young Children*, January 2005
Some children show **resiliency**, the ability to develop normally and thrive despite the presence of risk factors in their lives. This article describes factors that are common in resilient children, including heightened **sensory awareness and high expectations from others**. 85

The concepts in bold italics are developed in the article. For further expansion, please refer to the Topic Guide.

20. **Emotions and the Development of Childhood Depression: Bridging the Gap**, Pamela M. Cole, Joan Luby, and Margaret W. Sullivan, *Child Development Perspectives*, December 2008
 Our understanding of **typical** or **normal emotional development** can help us understand children who have **emotional problems**, and vice versa. The authors describe emotional development and **childhood depression**, identifying **risk factors** for the disorder and the roles of **negative emotions and positive emotions** in early development. 89

Part B. Entry into the Social World: Peers, Play, and Popularity

21. **Children’s Social and Moral Reasoning about Exclusion**, Melanie Killen, *Current Directions in Psychological Science*, February 2007
 How do children develop **morality**? Today researchers are looking at different forms of **social and moral reasoning** present in children. Using **social domain theory**, the article frames how **prejudice and stereotypes** form and how children **reason about exclusion**. 97

22. **A Profile of Bullying at School**, Dan Olweus, *Educational Leadership*, March 2003
Bullying involves the repeated exposure of negative actions by one or more peers toward an individual. In the past two decades, a **50 percent increase in the occurrence of bullying** has been documented. Leading expert Dan Olweus outlines the typical process involved with bullying and gives supporting data for a **prevention program** that he has developed over the past 20 years. 101

23. **When Girls and Boys Play: What Research Tells Us**, Jeanetta G. Riley and Rose B. Jones, *Childhood Education*, Fall 2007
 Play has many benefits for all children, but research shows that girls and boys often play in different ways. The authors review research on gender patterns in social interactions, physical play, and language usage. Implications for educators and parents are also discussed. 106

24. **Playtime in Peril**, Lea Winerman, *APA Monitor on Psychology*, September 2009
Recess and free play time are diminishing in children’s lives, replaced by **electronic media** and **“edutainment” toys**. This article argues for the valuable role **pretense and play** have in children’s **cognitive and academic growth**. 111

25. **The Role of Neurobiological Deficits in Childhood Antisocial Behavior**, Stephanie H. M. van Goozen, Graeme Fairchild, and Gordon T. Harold, *Current Directions in Psychological Science*, March 2008
 Some children early in childhood engage in antisocial behavior. There are biological and social influences on these problem behaviors. This article describes the interplay between children’s adverse early environments and certain neurobiological deficits that lead to antisocial behavior later in childhood. 113

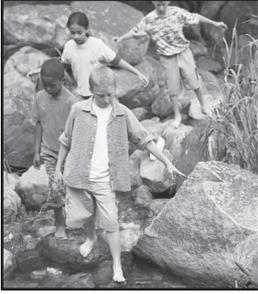

UNIT 4 Parenting and Family Issues

Unit Overview 118

26. **Children of Lesbian and Gay Parents**, Charlotte J. Patterson, *Current Directions in Psychological Science*, October 2006
 Does **parental sexual orientation** affect child development? After years of research, there is **little difference** between the children of heterosexual and homosexual parents. In fact, the **quality of relationships** in the family seems to matter more than parents’ sexual orientation. 120

27. **Evidence of Infants' Internal Working Models of Attachment**, Susan C. Johnson, Carol S. Dweck, and Frances S. Chen, *Psychological Science*, June 2007
Internal working models of attachment underlie the **instinctual behaviors** children display in their attachment relationships. The authors use an ingenious visual **habituation technique** to measure infants' internal working models of attachment, showing that infants' **personal attachment experiences** are reflected in their **abstract mental representations** of social interactions. 124
28. **Parental Divorce and Children's Adjustment**, Jennifer E. Lansford, *Perspectives on Psychological Science*, March 2009
This article reviews the research evidence on how **divorce affects children's short- and long-term development** in areas such as **academics, social relationships**, and **internalizing and externalizing symptoms**. Other potential mitigating factors are considered, such as **family income, child well-being** prior to divorce, and the timing of divorce. 126
29. **Within-Family Differences in Parent–Child Relations across the Life Course**, J. Jill Suitor et al., *Current Directions in Psychological Science*, May 2008
In the same family, parents often treat their children very differently. Such differential treatment and sometimes favoritism are expressed in different levels of closeness, support, and control of siblings. 140
30. **The Messy Room Dilemma: When to Ignore Behavior, When to Change It**, Alan E. Kazdin and Carlo Rotella, *slate.com*, March 27, 2009
One of the most challenging tasks for parents is **discipline**, knowing if and when to use **punishment, spanking, or positive reinforcement**. This article asks parents to consider carefully which misbehaviors they will focus on and for which they will “draw the line.” 145
31. **The Role of Parental Control in Children's Development in Western and East Asian Countries**, Eva M. Pomerantz and Qian Wang, *Current Directions in Psychological Science*, October 2009
Parental control over their children is a crucial dimension of parenting and **discipline**, yet too much control can have negative effects on children. This article examines how parental control is situated in **different cultures** and may affect children differently in the United States and East Asian countries. 148
32. **Fatal Distraction: Forgetting a Child in the Backseat of a Car Is a Horrifying Mistake. Is It a Crime?**, Gene Weingarten, *The Washington Post*, April 3, 2009
Each year, **children die** as a result of being left in an overheated vehicle. Is this **neglect** and should these **parents be punished?** Gene Weingarten writes about this horrific occurrence and asks readers to consider whether it could happen to them. 153
33. **Siblings Play Formative, Influential Role as 'Agents of Socialization'**, From *ScienceDaily*, January 20, 2010
Siblings play an important, formative role in children's development. Children especially look up to and try to emulate the behaviors of their older siblings. This doesn't mean that children turn out like their elder siblings; most want to carve out their own path, their own identity as they mature. 156

UNIT 5

Cultural and Societal Influences

Unit Overview 158

Part A. Social and Cultural Issues

34. Goodbye to Girlhood, Stacy Weiner, *The Washington Post*, February 20, 2007

This article describes the troubling trend in the way women and girls are **depicted by the media**. Pop culture images are **targeting younger girls**, and the psychological damage as a result may include **eating disorders, lower self-esteem**, and **depression**.

160

35. Trials for Parents Who Chose Faith over Medicine, Dirk Johnson, *The New York Times*, January 21, 2009

A child is seriously ill, but the **parents' religious beliefs** forbid any standard medical treatment. What are the **child's and parents' rights** here, and whose should be legally protected? Johnson describes some recent real-life American families that are struggling with these challenges.

163

Part B. Special Challenges

36. Childhood's End, Christopher Hitchens, *Vanity Fair*, January 2006

In an ongoing tragedy, **children in Uganda** have been victimized in many ways, from being murdered to raped; many children are **enslaved as soldiers** who kill and maim other children. Terrible **political and economic** conditions contribute to this nightmare.

165

37. How to Win the Weight Battle, Deborah Kotz, *U.S. News & World Report*, September 10, 2007

Many experts now believe that the emphasis on **dropping weight** rather than adding healthy **nutrients and exercise** is doing more harm than good. This article discusses **various approaches that schools are adopting** to address **child obesity in America**, such as Planet Health and CATCH.

168

38. The Epidemic That Wasn't, Susan Okie, *The New York Times*, January 27, 2009

In the 1980s, increased use of **crack cocaine** was seized by the media to fan the flames of fears of a generation of "**crack babies**." However, the data show that while cocaine exposure is certainly dangerous for the fetus, the developments of former crack babies are often more positive than originally predicted on outcomes such as **IQ, attention, and executive function**.

172

39. The Positives of Caregiving: Mothers' Experiences Caregiving for a Child with Autism, Michael K. Corman, *Families in Society: The Journal of Contemporary Social Services*, vol. 90, no. 4, 2009

Although much research on autism focuses on stress and coping, the study reported in this article addresses **resilience exhibited by mothers providing care** to an autistic child. Mothers identify experiences that are appraised in a positive, even joyous, light. Practical implications are included.

174

40. Three Reasons Not to Believe in an Autism Epidemic, Morton Ann Gernsbacher, Michelle Dawson, and H. Hill Goldsmith, *Current Directions in Psychological Science*, February 2005

According to conventional wisdom, there is a surge in the number of children with autism. These scientists challenge such claims, arguing that these public perceptions are actually due to changes in diagnostic criteria for autism as well as sloppy analysis of the data.

182

<p>41. Getting Back to the Great Outdoors, Amy Novotney, <i>APA Monitor on Psychology</i>, March 2008</p> <p>This article examines children's physical well-being and also includes concepts such as increased cognitive ability and increased resilience against stress and adversity. Psychologists are helping children reconnect with nature through varied efforts, such as conducting research, incorporating the outdoors in clinical interventions, and educating parents on the benefits associated with outdoor experiences.</p>	186
<p>42. Treatment and Prevention of Posttraumatic Stress Reactions in Children and Adolescents Exposed to Disasters and Terrorism: What Is the Evidence?, Annette M. La Greca and Wendy K. Silverman, <i>Child Development Perspectives</i>, April 2009</p> <p>Many children are exposed to traumatic experiences, from terrorism to natural disasters. La Greca and Silverman review various treatment methods for helping children and youth with posttraumatic stress. Some treatments have no data to confirm their efficacy but others do.</p>	188
Test-Your-Knowledge	194
Article Rating Form	195

The concepts in bold italics are developed in the article. For further expansion, please refer to the Topic Guide.
