

Visual Guide

1. Introduction

The chapter introduction provides a quick look into the concepts discussed in the chapter.

Introduction to Computer Graphics

1.1 INTRODUCTION

Computer graphics offers methods and techniques for generating and manipulating images on a computer. The main branches of computer graphics are:

- Generative computer graphics
- Image processing and
- Image analysis

Generative graphics, image processing and analysis represent an exciting and cognitive world of computer science and engineering graphics. An explosion of interest in computer graphics during 1960s, 70s and 80s was marked by significant progress in the field. Computer graphics find application in diverse areas such as science, engineering, medicine, business, industry, art, entertainment, advertising, education and training etc.

All areas mentioned above can be summarized in terms of functionality of computer graphics as given in Table 1.1.

Table 1.1: Areas of Computer Graphics

Computer Area	Image	Description
Image	Image processing	Generative Computer Graphics
Description	Image analysis	Everything Else

Computer graphics aims at duplicating the effect of human perception of viewing and understanding three dimensional 3D objects by displaying it on the monitor in various ways of representation. The capability of displaying objects on a computer in an explicit, distinctive and meaningful way is not an easy task. Objects are

in three dimensional 3D world, viewers try to analyse objects in 3D space but the computer displays two dimensional images with an expectation of no loss of information. Computer graphics concerns the pictorial synthesis of real or imaginary objects from their computer based models, whereas the related field of image processing deals the converse process, i.e. the analysis of scene or the reconstruction of 2D or 3D objects from their pictures. Image analysis is important in areas like aerial surveillance photography, slow scan television images of the moon or planets gathered from space probes, satellite images taken from an industrial robot's eyes, chromosome scans, X-ray images, computerized tomographic scans and 3D laser scans.

                                Chapter System 3 27

TEST01N.DPP
//A C++ Program demonstrating the above button classes
#include "button.cpp"
#include "graphics.h"
#include <conio.h>
#include <stdlib.h>

void main(void)
{
    int gd=0, gm=0;
    int gdriver=0, gmode, h=500, w=500;
    button btn1(btn1(200,200,"Button Bulged"));
    delay(1000);
    btn1._mouse("Button Pressed");
    btn1._mouse_pressed();
    delay(1000);
    btn1._mouse("Button Bulged");
    btn1._mouse_pressed();
    delay(1000);
    btn1._mouse("Button Pressed");
    btn1._mouse_pressed();
    getch();
}
    
```

Solved Exercises

- 2.1. Compute the following:
- (a) Size of 800 × 600 image at 300 pixels per inch.
 - (b) Resolution of 7 × 7 inch of image that has 512 × 512 pixels.
 - (c) Height of the printed image 3024 × 768 in size that is 480 pixels wide with the same aspect ratio.
 - (d) Width of an image having height of 7 inches and an aspect ratio 1.5.
- Solutions:**
- (a) 240 pixels corresponding to 1 inch.
 - 7 × 800 pixels will correspond to 800/240 inch = 3 1/3 inch
 - Similarly 600 pixels / 300/240 = 2 2/3 inch
 - Hence the size of the image is 3 1/3 inch × 2 2/3 inch.
 - (b) 3024 = 240 pixels per inch.
 - (c) Aspect ratio of the 1024 × 768 image is 768/1024 = 3/4.
 - Hence, width of the image having height of 140 pixels having aspect ratio 3/4 is 140 × 3/4 = 105.
 - (d) Width of the image of aspect ratio 1.5 × 7 = 10.5.

2. Solved Exercises

Every chapter contains worked-out examples which will guide the student in understanding the concepts and to solve the exercise problems.

3. Review Questions
 The text contains many Review Questions for the students to work out and practice. This will hone their problem-solving skills to a great extent.

Introduction to Multimedia / 255

```
int main(int argc, char* argv, char* envp)
{
    fclose(stdin);
    getch();
    setmode(stdin); //set back to the text mode
}
```

Fig. 16.8 Output of the above listed program

Review Questions

- 16.1 Describe the MPC specification for a multimedia PC.
- 16.2 What are the various components of multimedia? How does it affect human perception and understanding?
- 16.3 What are the various applications of multimedia? Why does it require a high end PC?
- 16.4 Briefly explain the visual components of multimedia? Why graphics file format is necessary?
- 16.5 What are the differences between BMP and PCX file formats?
- 16.6 Discuss the audio components of multimedia? How WAV and MP3 file formats are implemented for audio storage and interchange?
- 16.7 What is a Compact Disk? How does a CD drive store and retrieve data on a CD?
- 16.8 How does DVD differs from a CD? How is it superior to a normal CD?
- 16.9 Write a C code for loading a BMP image file, of size greater than the set screen resolution on to computer screen. Image may be scaled down or the excess portion of the image may be clipped against the screen boundaries.
- 16.10 Write a C code for loading a PCX file centered at a window having dimensions 100 x 100 located at any suitable position on the screen. Maintain the aspect ratio of the image and scale it to fit within the window.
- 16.11 How can you make better use of multimedia in education and training (recorded audio and animation)?

CHAPTER 16

Windowing and Clipping / 141

Fig. 2.14 Non Clipping using naive Clipping Algorithm

Shortcuts

In this chapter, many tools are developed that make possible for the programmers to think and work directly in the more convenient world coordinate system. Objects are modeled in that concern for where or how big the picture of the object will be on screen. The window and viewport are defined for part of the object to be drawn and how it is to appear on the display. Clipping techniques can be used as powerful tools as discussed. Clipping algorithms are developed for displaying portions of picture to be made of 2D graphics primitives (i.e., curves and texts) and winning use of the portion to be screened.

Computer Codes

Program 2.1: Cohen-Sutherland line clipping program to clip the line outside the window boundary.

Source code in C

```
#include <stdio.h>
#include <math.h>
#include <graphics.h>
#include <conio.h>

typedef unsigned char BYTE; // 0 to 255 or 0 to 1111-1111 1..e 0xFF

BYTE printcheck(int x, int y);
BYTE bit1check(int p);
BYTE bit2check(int p);
BYTE bit3check(int p);
BYTE bit4check(int p);
int window1world();

int main(void)
{
    //Graphics mode initialization to 640x480 resolution
    int gdr VGA_getGDR();
```

CHAPTER 5

4. Computer Codes
 Every chapter contains Computer Codes to help in implementing the concepts learnt in the chapter.

5. Figures

Figures are used exhaustively in the text to illustrate the concepts and methods described.

6. Summary

A summary gives the essence of each chapter in brief and will be helpful for a quick review before the examination.
