

# Chapter 11

## Project Analysis and Evaluation

### Chapter Organization

- 11.1 Evaluating NPV Estimates
- 11.2 Scenario and Other “What-if” Analyses
- 11.3 Break-Even Analysis
- 11.4 Operating Cash Flow, Sales Volume, and Break-Even
- 11.5 Operating Leverage
- 11.6 Additional Considerations in Capital Budgeting
- 11.7 Summary and Conclusions

- The basic problem: How reliable is our NPV estimate?
  - ◆ **Projected vs. Actual cash flows**

Estimated cash flows are based on a distribution of possible outcomes each period
  - ◆ **Forecasting risk**

The possibility of a bad decision due to errors in cash flow projections - the GIGO phenomenon
  - ◆ **Sources of value**

What conditions must exist to create the estimated NPV?

“What If” analysis

    - A. Scenario analysis
    - B. Sensitivity analysis

- Scenario and Other “What-If” Analyses
  - ◆ “Base case” estimation
    - Estimated NPV based on initial cash flow projections
  - ◆ Scenario analysis
    - Posit best- and worst-case scenarios and calculate NPVs
  - ◆ Sensitivity analysis
    - How does the estimated NPV change when one of the input variables changes?
  - ◆ Simulation analysis
    - Vary several input variables simultaneously, then construct a distribution of possible NPV estimates

## T11.4 Fairways Driving Range Example

- Fairways Driving Range expects rentals to be 20,000 buckets at \$3 per bucket. Equipment costs \$20,000 and will be depreciated using SL over 5 years and have a \$0 salvage value. Variable costs are 10% of rentals and fixed costs are \$40,000 per year. Assume no increase in working capital nor any additional capital outlays. The required return is 15% and the tax rate is 15%.

Revenues	\$60,000
Variable costs	6,000
Fixed costs	40,000
<hr/> Depreciation	<u>4,000</u>
EBIT	\$10,000
Taxes (@15%)	<u>1500</u>
Net income	\$ 8,500

## T11.4 Fairways Driving Range Example (concluded)

- Estimated annual cash inflows:

$$\$10,000 + 4,000 - 1,500 = \$12,500$$

- At 15%, the 5-year annuity factor is 3.352. Thus, the *base-case NPV* is:

$$\text{NPV} = \$-20,000 + (\$12,500 \times 3.352) = \$21,900.$$

## T11.5 Fairways Driving Range Scenario Analysis

### INPUTS FOR SCENARIO ANALYSIS

- **Base case:** Rentals are 20,000 buckets, variable costs are 10% of revenues, fixed costs are \$40,000, depreciation is \$4,000 per year, and the tax rate is 15%.
- **Best case:** Rentals are 25,000 buckets, variable costs are 8% of revenues, fixed costs are \$40,000, depreciation is \$4,000 per year, and the tax rate is 15%.
- **Worst case:** Rentals are 18,000 buckets, variable costs are 12% of revenues, fixed costs are \$40,000, depreciation is \$4,000 per year, and the tax rate is 15%.

## T11.5 Fairways Driving Range Scenario Analysis (concluded)

<u>Scenario</u>	<u>Rentals</u>	<u>Revenues</u>	<u>Net Income</u>	<u>Project Cash Flow</u>	<u>NPV</u>
Best Case	25,000	\$75,000	\$21,250	\$25,250	\$64,635
Base Case	20,000	60,000	8,500	12,500	21,900
Worst Case	18,000	54,000	2,992	6,992	3,437

## T11.6 Fairways Driving Range Sensitivity Analysis

### INPUTS FOR SENSITIVITY ANALYSIS

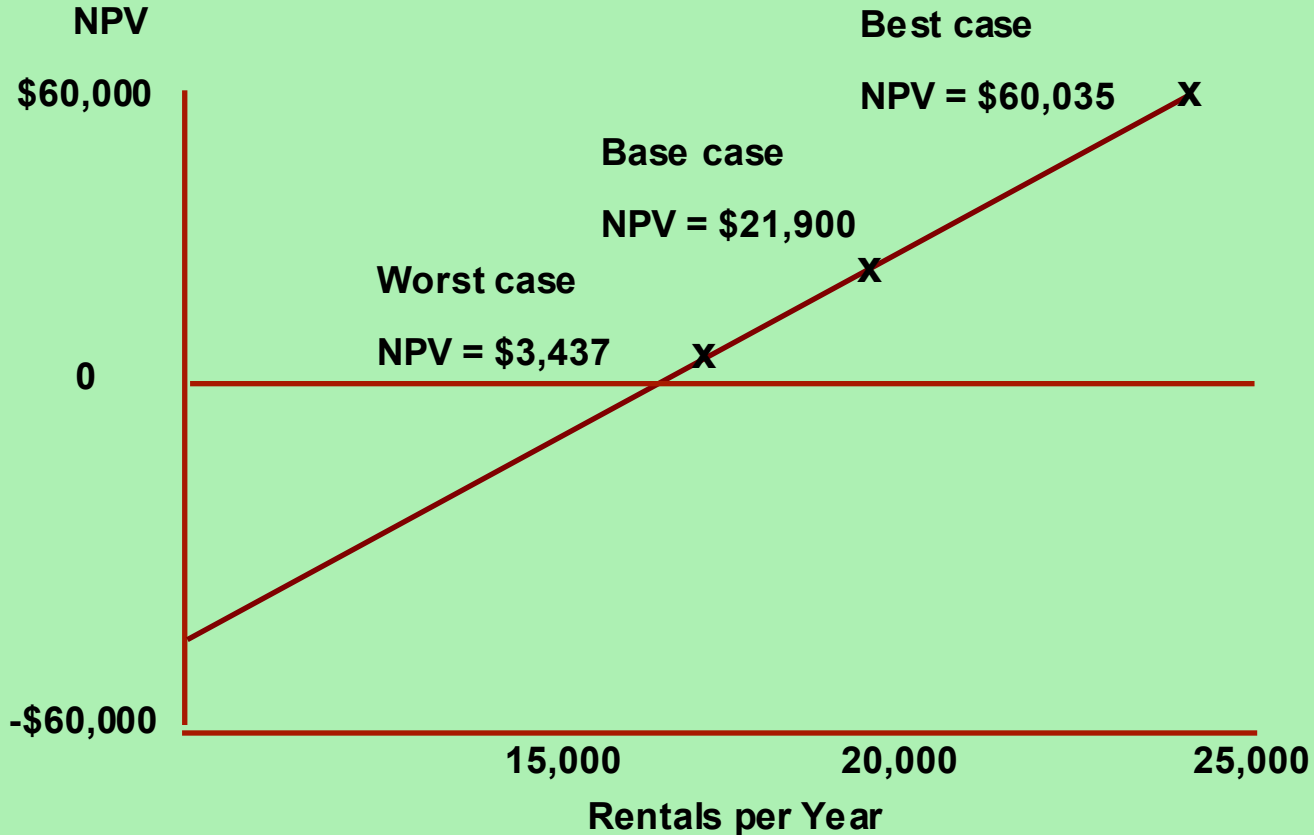

- **Base case:** Rentals are 20,000 buckets, variable costs are 10% of revenues, fixed costs are \$40,000, depreciation is \$4,000 per year, and the tax rate is 15%.
- **Best case:** Rentals are 25,000 buckets and revenues are \$75,000. All other variables are unchanged.
- **Worst case:** Rentals are 18,000 buckets and revenues are \$54,000. All other variables are unchanged.

## T11.6 Fairways Driving Range Range Sensitivity Analysis (concluded)

<u>Scenario</u>	<u>Rentals</u>	<u>Revenues</u>	<u>Net income</u>	<u>Project cash flow</u>	<u>NPV</u>
Best case	25,000	\$75,000	\$19,975	\$23,975	\$60,364
Base case	20,000	60,000	8,500	12,500	21,900
Worst case	18,000	54,000	3,910	7,910	6,514

## T11.7 Fairways Driving Range: Rentals vs. NPV

Fairways Sensitivity Analysis - Rentals vs. NPV

## T11.8 Fairways Driving Range: Total Cost Calculations

- Total Cost = Variable cost + Fixed cost

Rentals	Revenue	Variable cost	Fixed cost	Total cost	Depr.	Total acct. cost
0	\$0	\$0	\$40,000	\$40,000	\$4,000	\$44,000
15,000	45,000	4,500	40,000	44,500	4,000	48,500
20,000	60,000	6,000	40,000	46,000	4,000	50,000
25,000	75,000	7,500	40,000	47,500	4,000	51,500

## T11.9 Fairways Driving Range: Break-Even Analysis

Fairways Break-Even Analysis - Sales vs. Costs and Rentals

## T11.10 Fairways Driving Range: Accounting Break-Even Quantity

### ■ Fairways Accounting Break-Even Quantity (Q)

$$Q = (\text{Fixed costs} + \text{Depreciation}) / (\text{Price per unit} - \text{Variable cost per unit})$$

$$= (\text{FC} + \text{D}) / (\text{P} - \text{V})$$

$$= (\$40,000 + 4,000) / (\$3.00 - .30)$$

$$= 16,296 \text{ buckets}$$

*If sales do not reach 16,296 buckets, the firm will incur losses in both the accounting sense and the financial sense .*

## T11.11 Chapter 11 Quick Quiz -- Part 1 of 2

Assume you have the following information about Vanover Manufacturing:

- Price = \$5 per unit; variable costs = \$3 per unit
- Fixed operating costs = \$10,000
- Initial cost is \$20,000
- 5 year life; straight-line depreciation to 0, no salvage value
- Assume no taxes
- Required return = 20%

## T11.11 Chapter 11 Quick Quiz -- Part 1 of 2 (concluded)

### ■ Break-Even Computations

#### A. Accounting Break-Even

$$Q = (FC + D)/(P - V) = (\$ \underline{\hspace{1cm}} + \$4,000)/(\$5 - 3) = \underline{\hspace{1cm}} \text{ units}$$

$$\text{IRR} = \underline{\hspace{1cm}} ; \text{NPV} \underline{\hspace{1cm}} (= -\$ \underline{\hspace{1cm}})$$

#### B. Cash Break-Even

$$Q = FC/(P - V) = \$10,000/(\$5 - 3) = \underline{\hspace{1cm}} \text{ units}$$

$$\text{IRR} = \underline{\hspace{1cm}} ; \text{NPV} = \underline{\hspace{1cm}}$$

#### B. Financial Break-Even

$$Q = (FC + \$6,688)/(P - V)$$

$$= (\$10,000 + 6,688)/(\$5 - 3) = 8,344 \text{ units}$$

$$\text{IRR} = \underline{\hspace{1cm}} ; \text{NPV} = \underline{\hspace{1cm}}$$

## T11.11 Chapter 11 Quick Quiz -- Part 1 of 2 (concluded)

### ■ Break-Even Computations

#### A. Accounting Break-Even

$$Q = (FC + D)/(P - V) = (\$10,000 + \$4,000)/(\$5 - 3) = 7,000 \text{ units}$$

$$\text{IRR} = 0 \text{ ; NPV} = -\$8,038$$

#### B. Cash Break-Even

$$Q = FC/(P - V) = \$10,000/(\$5 - 3) = 5,000 \text{ units}$$

$$\text{IRR} = -100\% \text{ ; NPV} = -\$20,000$$

#### B. Financial Break-Even

$$Q = (FC + \$6,688)/(P - V)$$

$$= (\$10,000 + 6,688)/(\$5 - 3) = 8,344 \text{ units}$$

$$\text{IRR} = 20\% \text{ ; NPV} = 0$$

## T11.12 Summary of Break-Even Measures (Table 11.1)

### I. The General Expression

$$Q = (FC + OCF)/(P - V)$$

where: FC = total fixed costs

P = Price per unit

v = variable cost per unit

### II. The Accounting Break-Even Point

$$Q = (FC + D)/(P - V)$$

*At the Accounting BEP, net income = 0, NPV is negative, and IRR of 0.*

### III. The Cash Break-Even Point

$$Q = FC/(P - V)$$

*At the Cash BEP, operating cash flow = 0, NPV is negative, and IRR = -100%.*

### IV. The Financial Break-Even Point

$$Q = (FC + OCF^*)/(P - V)$$

*At the Financial BEP, NPV = 0 and IRR = required return.*

## T11.13 Fairways Driving Range DOL

- Since  $\% \Delta$  in OCF = DOL  $\times$   $\% \Delta$  in Q, DOL is a “multiplier” which measures the effect of a change in quantity sold on OCF.
- For Fairways, let Q = 20,000 buckets. Ignoring taxes,

OCF = \$14,000 and fixed costs = \$40,000, and

Fairway's DOL =  $1 + FC/OCF = 1 + \$40,000/\$14,000 = 3.857$ .

In other words, a 10% increase (decrease) in quantity sold will result in a **38.57%** increase (decrease) in OCF.

- Two points should be kept in mind:

*Higher DOL suggests greater volatility (i.e., risk) in OCF;*

*Leverage is a two-edged sword - sales decreases will be magnified as much as increases.*

## T11.14 Managerial Options and Capital Budgeting

### ■ Managerial options and capital budgeting

#### ◆ What is ignored in a static DCF analysis?

Management's ability to modify the project as events occur.

#### ◆ Contingency planning

1. The option to expand
2. The option to abandon
3. The option to wait

#### ◆ Strategic options

1. "Toehold" investments
2. Research and development

***Generally, the exclusion of managerial options from the analysis causes us to underestimate the "true" NPV of a project. Why?***

## T11.15 Capital Rationing

### ■ Capital rationing

- ◆ Definition: The situation in which the firm has more good projects than money.
- ◆ **Soft rationing** - limits on capital investment funds set within the firm.

*How could this occur in a firm run by rational managers?*

- ◆ **Hard rationing** - limits on capital investment funds set outside of the firm (i.e., in the capital markets).
- How could this occur in capital markets populated by rational investors?*

## T11.16 Chapter 11 Quick Quiz -- Part 2 of 2

1. What is forecasting risk?

*It is the possibility that errors in projected cash flows will lead to incorrect decisions.*

2. What is scenario analysis? Why might this exercise be useful for decision-makers to perform, even if their estimates ultimately turn out to be incorrect?

*It uses estimates of "Best- and Worst-case" outcomes to see what happens to NPV estimates if things turn out differently than expected. It forces decision-makers to think about the possibility of alternative outcomes.*

3. Is it conceivable that the opposite of capital rationing could exist?

*Yes - since capital rationing means more good projects than money, the opposite simply means more money than good projects.*

## T11.17 Solution to Problem 11.1

- BetaBlockers, Inc. (BBI) manufactures biotech sunglasses. The variable materials cost is \$0.68 per unit and the variable labor cost is \$2.08 per unit.
- What is the variable cost per unit?

VC = variable material cost + variable labor cost

$$= \$0.68 + \$2.08 = \$2.76$$

- Suppose BBI incurs fixed costs of \$520,000 during a year when production is 250,000 units. What are total costs for the year?

TC = total variable costs + fixed costs

$$= (\$2.76)( \underline{\hspace{2cm}} ) + \$ \underline{\hspace{2cm}} = \$ \underline{\hspace{2cm}}$$

## T11.17 Solution to Problem 11.1

- BetaBlockers, Inc. (BBI) manufactures biotech sunglasses. The variable materials cost is \$0.68 per unit and the variable labor cost is \$2.08 per unit.
- What is the variable cost per unit?

VC = variable material cost + variable labor cost

$$= \$0.68 + \$2.08 = \$2.76$$

- Suppose BBI incurs fixed costs of \$520,000 during a year when production is 250,000 units. What are total costs for the year?

TC = total variable costs + fixed costs

$$= (\$2.76)(250,000) + \$520,000 = \$1,210,000$$

## T11.17 Solution to Problem 11.1 (concluded)

- If the selling price is \$6.00 per unit, does BBI break even on a cash basis? If depreciation is \$150,000 per year, what is the accounting break-even point?

$$Q_{\text{cash}} = \$520,000 / (\$ \underline{\hspace{2cm}} - \$ \underline{\hspace{2cm}})$$
$$= \underline{\hspace{2cm}} \text{ units}$$

$$Q_{\text{acct}} = (\$ \underline{\hspace{2cm}} + \$ \underline{\hspace{2cm}}) / (\$6.00 - \$2.76)$$
$$= \underline{\hspace{2cm}} \text{ units}$$

## T11.17 Solution to Problem 11.1 (concluded)

- If the selling price is \$6.00 per unit, does BBI break even on a cash basis? If depreciation is \$150,000 per year, what is the accounting break-even point?

$$\begin{aligned}Q_{\text{cash}} &= \$520,000 / (\$ 6.00 - \$ 2.76 ) \\ &= 160,494 \text{ units}\end{aligned}$$

$$\begin{aligned}Q_{\text{acct}} &= (\$520,000 + \$150,000) / (\$6.00 - \$2.76) \\ &= 206,790 \text{ units}\end{aligned}$$

## T11.18 Solution to Problem 11.7

- In each of the following cases, calculate the accounting break-even and the cash break-even points. Ignore any tax effects in calculating the cash break-even.

<u>Unit price</u>	<u>Unit VC</u>	<u>Fixed costs</u>	<u>Depreciation</u>
\$1,900	\$1,750	\$16 million	\$7 million
30	26	60,000	150,000
7	2	300	365

## T11.18 Solution to Problem 11.7 (concluded)

### Solutions

$$(1) Q_{\text{acct}} = (\$16\text{M} + \$\_\_\_\_) / (\$1,900 - \$1,750) = \_\_\_\_\_\_ \text{ units}$$

$$Q_{\text{cash}} = \$16\text{M} / (\$\_\_\_\_\_\_ - \$\_\_\_\_\_\_) = 106,667 \text{ units}$$

$$(2) Q_{\text{acct}} = (\$60\text{K} + \$150\text{K}) / (\$\_\_\_ - \$26) = 52,500 \text{ units}$$

$$Q_{\text{cash}} = \$\_\_\_\_\_\_ / (\$30 - \$26) = \_\_\_\_\_\_ \text{ units}$$

$$(3) Q_{\text{acct}} = (\$300 + \$365) / (\$7 - \$2) = \_\_\_\_ \text{ units}$$

$$Q_{\text{cash}} = \$300 / (\$7 - \$2) = 60 \text{ units}$$

## T11.18 Solution to Problem 11.7 (concluded)

### Solutions

$$(1) Q_{\text{acct}} = (\$16\text{M} + \$7\text{m}) / (\$1,900 - \$1,750) = 153,334 \text{ units}$$

$$Q_{\text{cash}} = \$16\text{M} / (\$1,900 - \$1,750) = 106,667 \text{ units}$$

$$(2) Q_{\text{acct}} = (\$60\text{K} + \$150\text{K}) / (\$30 - \$26) = 52,500 \text{ units}$$

$$Q_{\text{cash}} = \$60,000 / (\$30 - \$26) = 15,000 \text{ units}$$

$$(3) Q_{\text{acct}} = (\$300 + \$365) / (\$7 - \$2) = 133 \text{ units}$$

$$Q_{\text{cash}} = \$300 / (\$7 - \$2) = 60 \text{ units}$$

## T11.19 Solution to Problem 11.13

- A proposed project has fixed costs of \$20,000 per year. OCF at 7,000 units is \$55,000. Ignoring taxes, what is the degree of operating leverage (DOL)?
- If units sold rises from 7,000 to 7,300, what will be the increase in OCF? What is the new DOL?

$$\text{DOL} = 1 + (\$20,000/\$55,000) = 1.3637$$

$$\% \Delta Q = (7,300 - 7,000)/7,000 = 4.29\%$$

*and*

$$\% \Delta \text{OCF} = \text{DOL}(\% \Delta Q) = \underline{\hspace{2cm}} (4.29) = \underline{\hspace{2cm}} \%$$

$$\text{New OCF} = (\$55,000)(\underline{\hspace{2cm}}) = \$\underline{\hspace{2cm}}$$

$$\text{DOL at 7,300 units} = 1 + (\$20,000/\$ \underline{\hspace{2cm}}) = \underline{\hspace{2cm}}$$

## T11.19 Solution to Problem 11.13

- A proposed project has fixed costs of \$20,000 per year. OCF at 7,000 units is \$55,000. Ignoring taxes, what is the degree of operating leverage (DOL)?
- If units sold rises from 7,000 to 7,300, what will be the increase in OCF? What is the new DOL?

$$\text{DOL} = 1 + (\$20,000/\$55,000) = 1.3637$$

$$\% \Delta Q = (7,300 - 7,000)/7,000 = 4.29\%$$

*and*

$$\% \Delta \text{OCF} = \text{DOL}(\% \Delta Q) = 1.3637 (4.29) = 5.85\%$$

$$\text{New OCF} = (\$55,000)(1.0585) = \$58,218$$

$$\text{DOL at 7,300 units} = 1 + (\$20,000/\$58,218) = 1.3435$$
