

# Chapter 2

# Applications and Layered Architectures

Chapter Figures

**Step:**

1.

The user clicks on a link to indicate which document is to be retrieved. The browser must determine the Internet address of the machine that contains the document. To do so, the browser sends a query to its local name server.

2.

Once the address is known, the browser establishes a connection to the server process in the specified machine, usually a TCP connection. For the connection to be successful, the specified machine must be ready to accept TCP connections.

3.

The browser runs a client version of HTTP, which issues a request specifying both the name of the document and the possible document formats it can handle.

4. – 6.

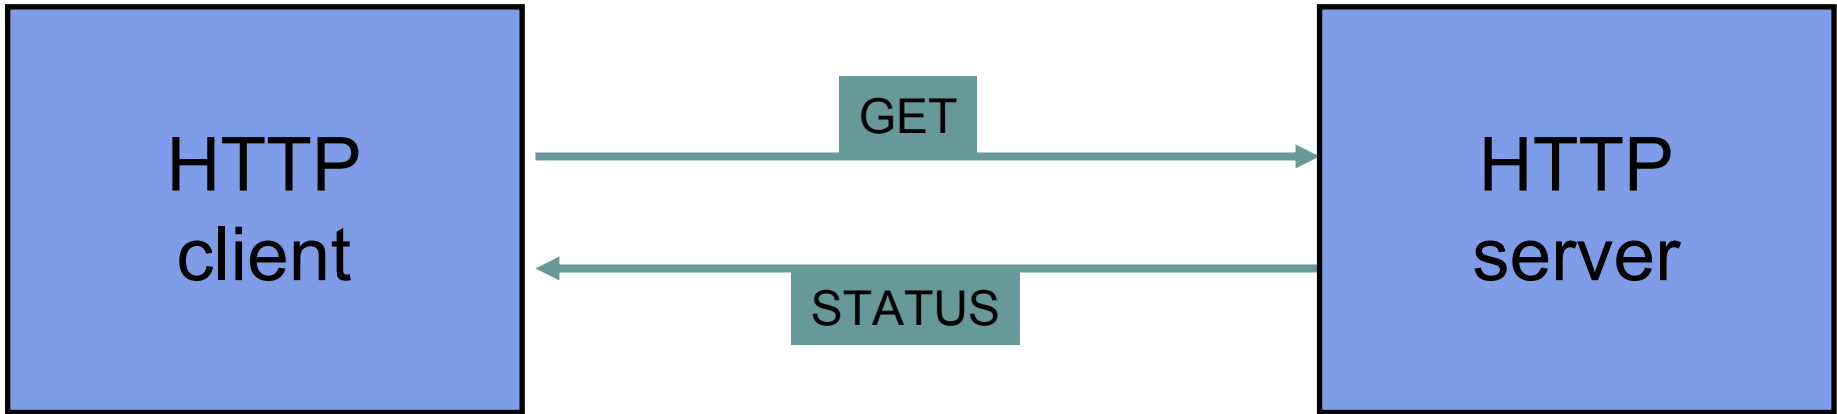

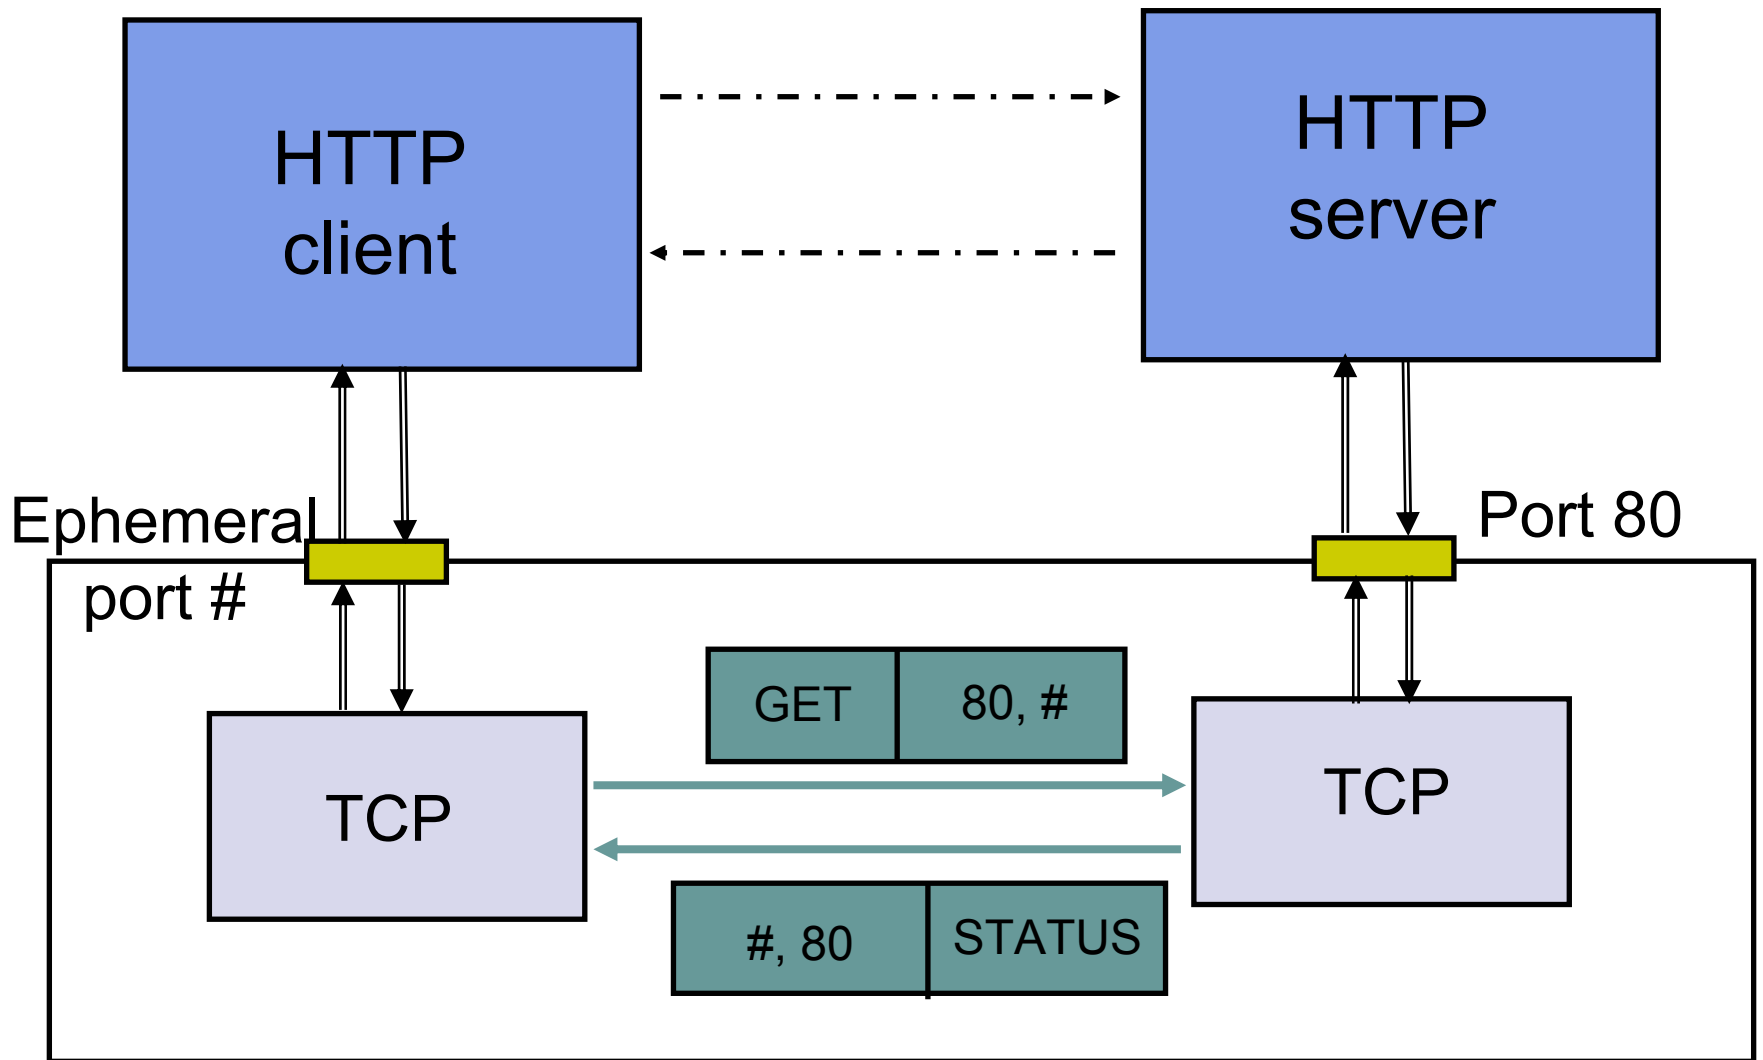

The machine that contains the requested document runs a server version of HTTP. It reacts to the HTTP request by sending an HTTP response which contains the desired document in the appropriate format.

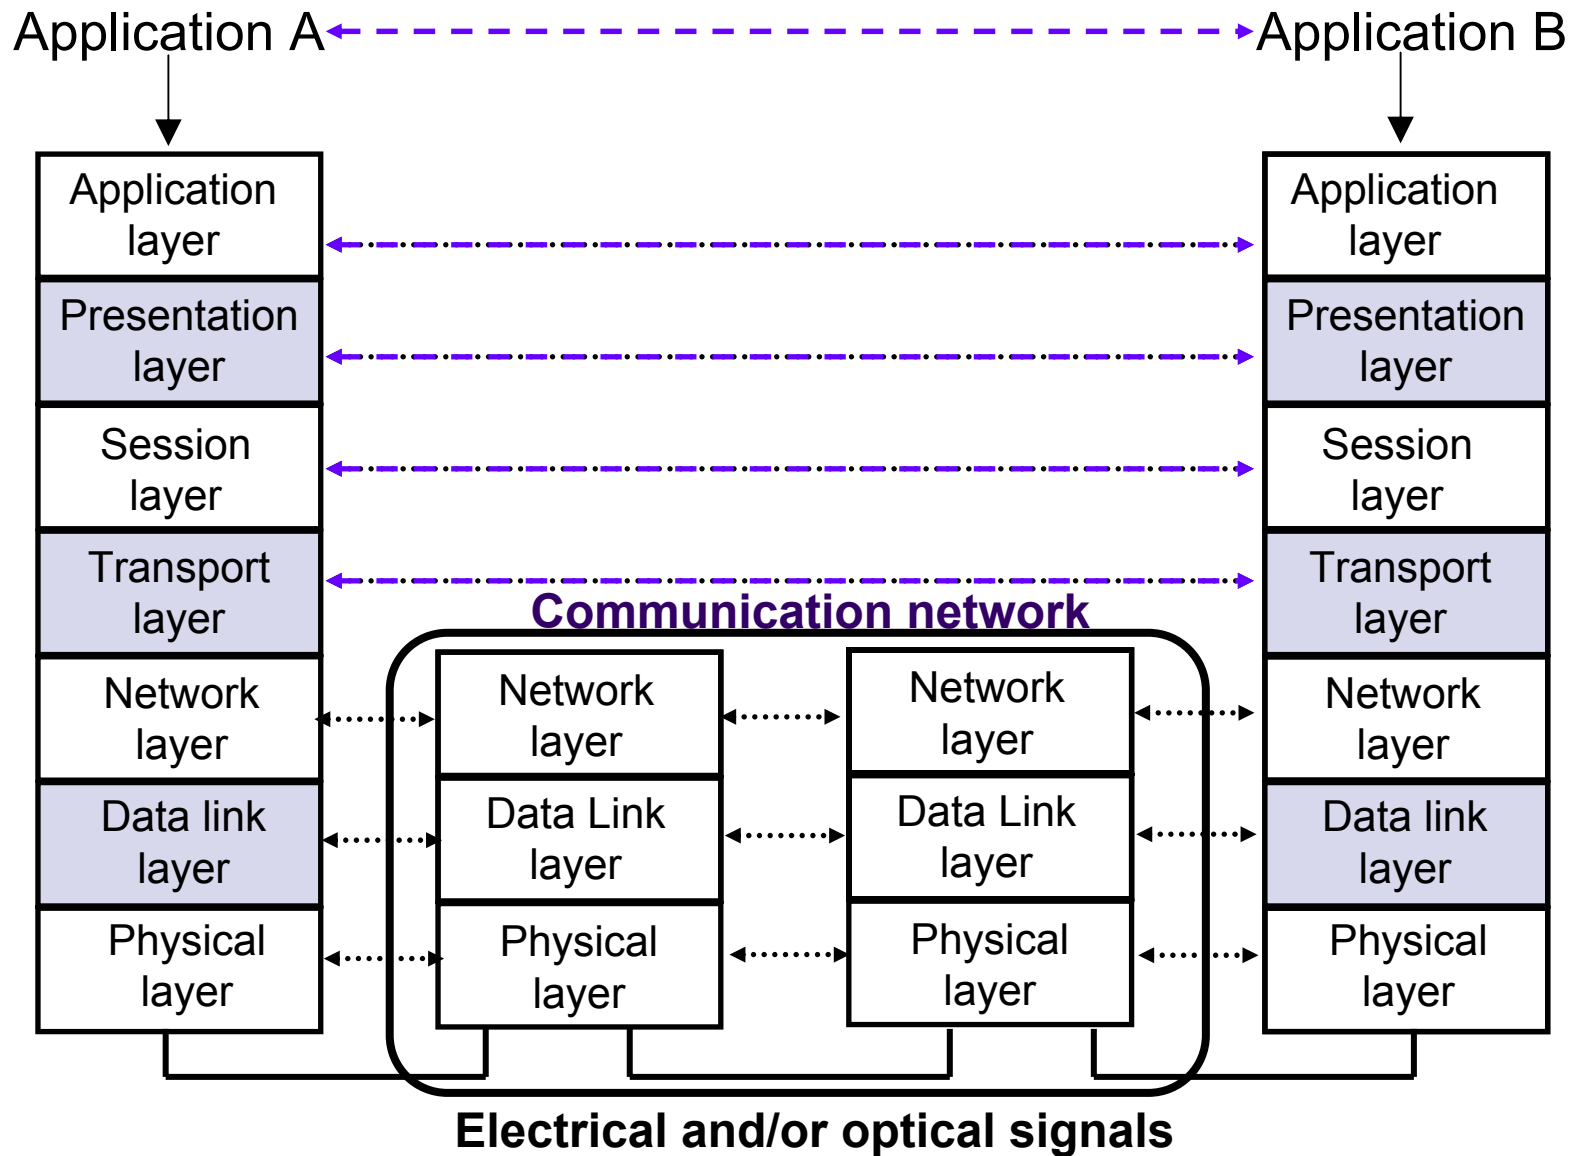

7. – 8.

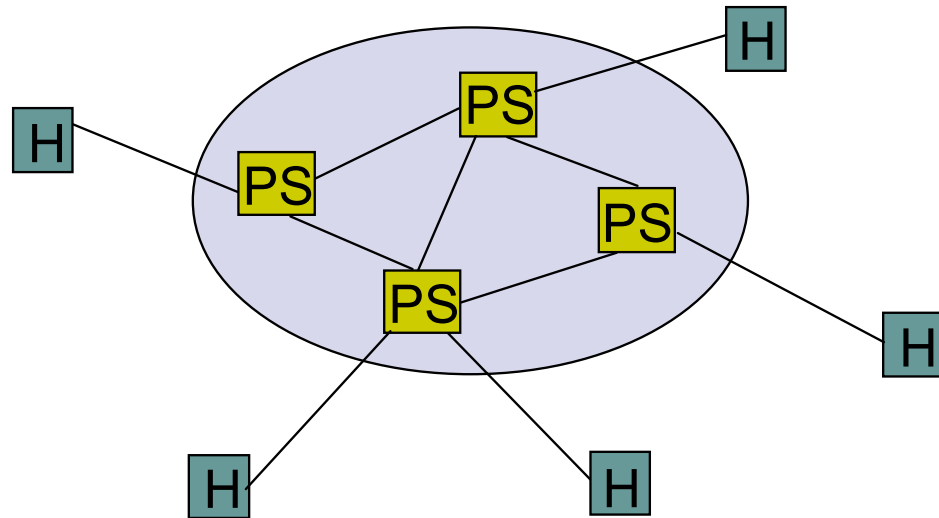

The user may start to view the document. The TCP connection is closed after a certain timeout period.

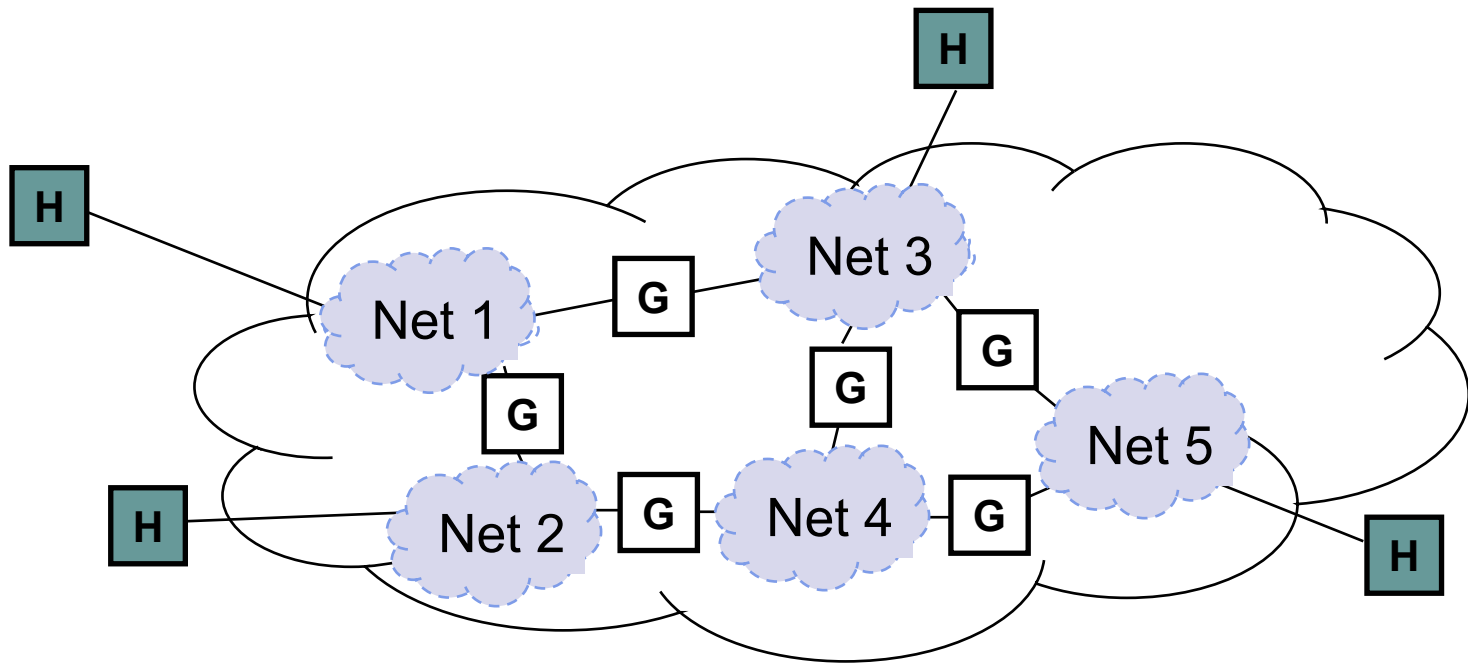

PS = packet switch  
H = host

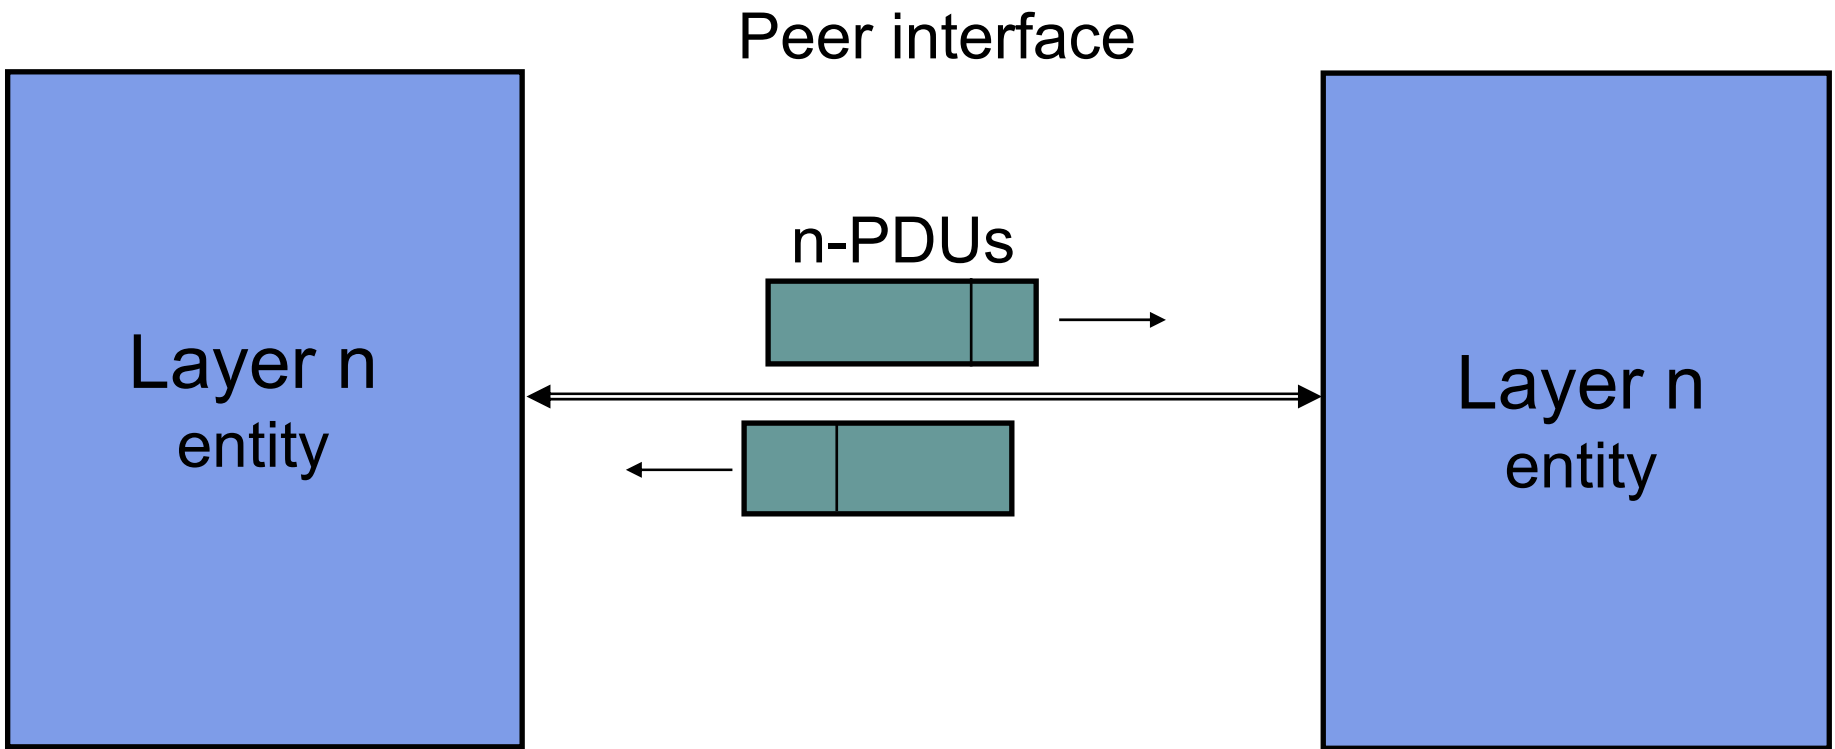

G = gateway/ router

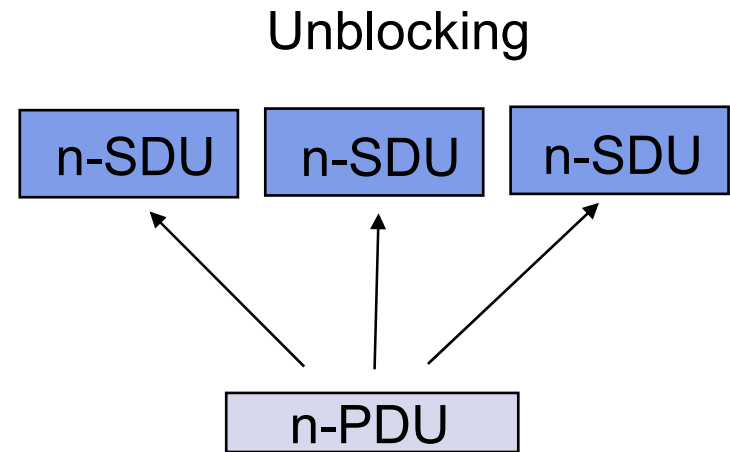

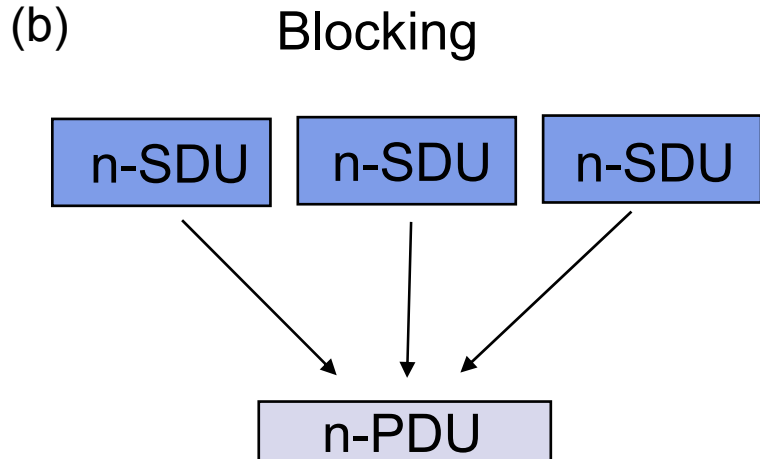

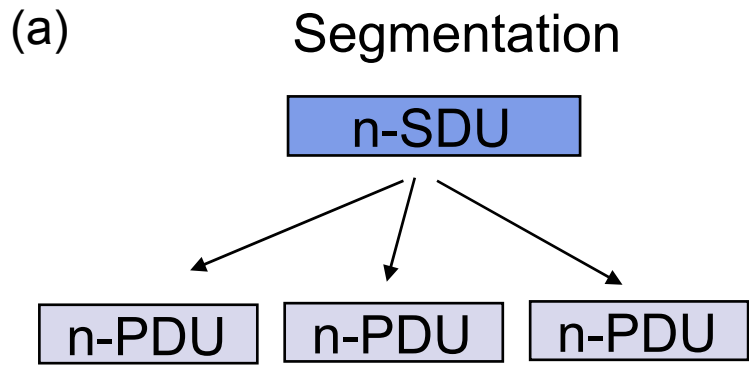

H = host

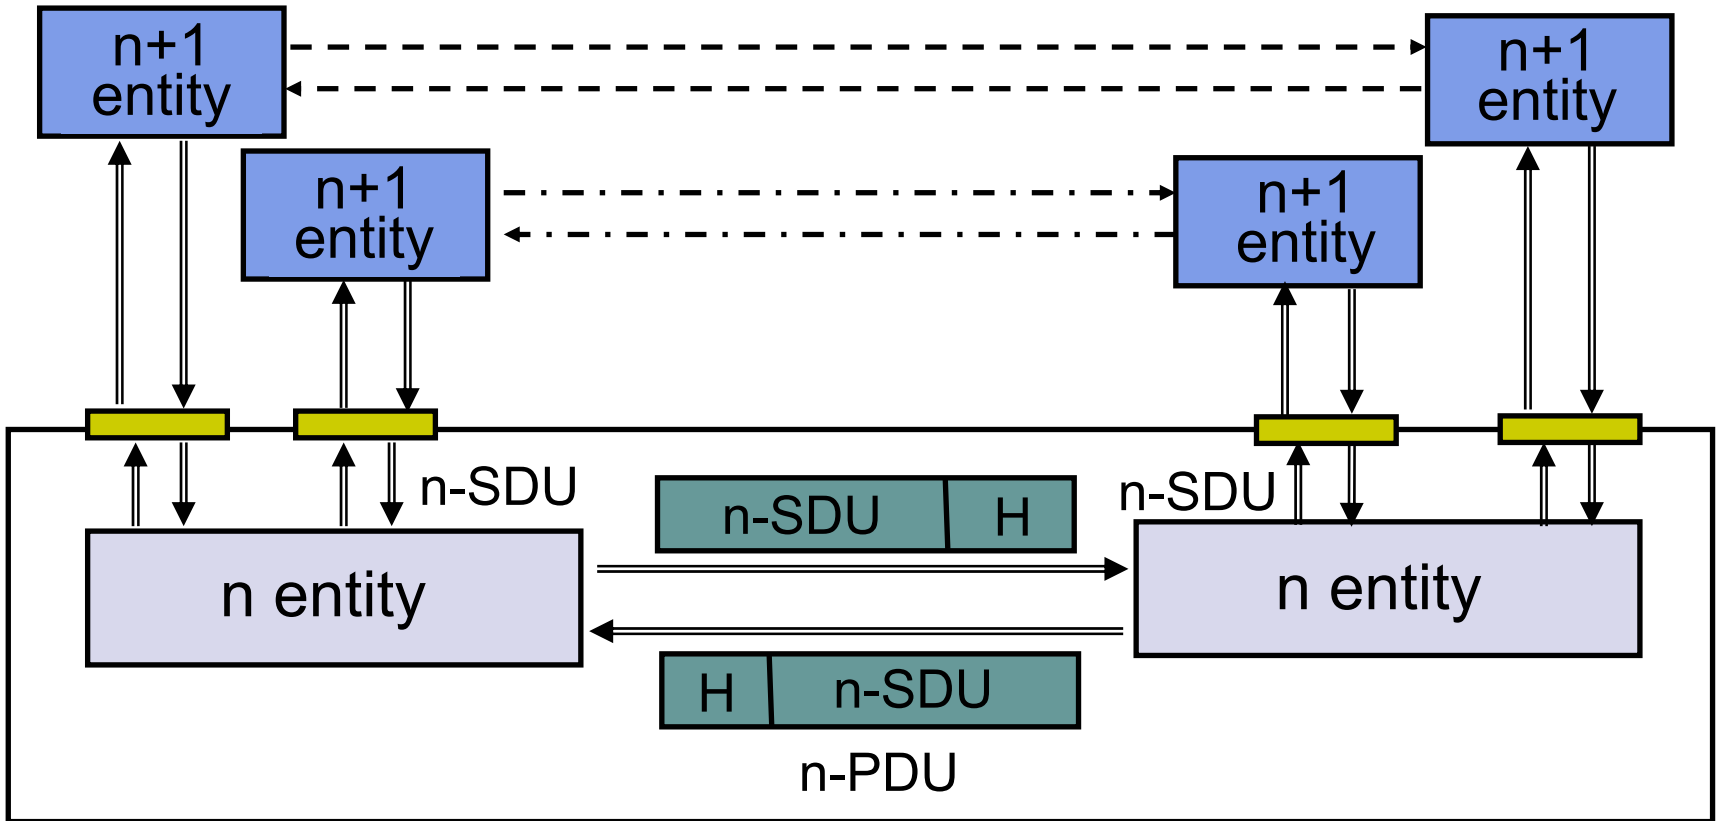

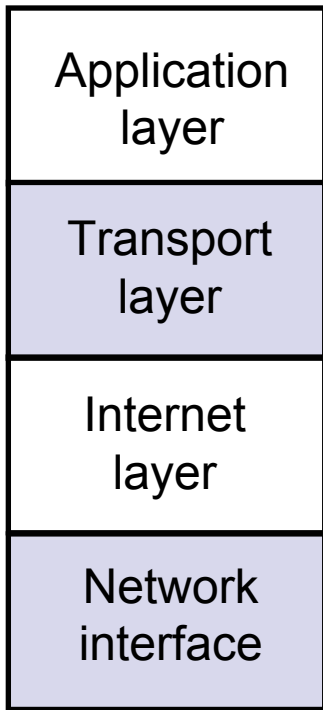

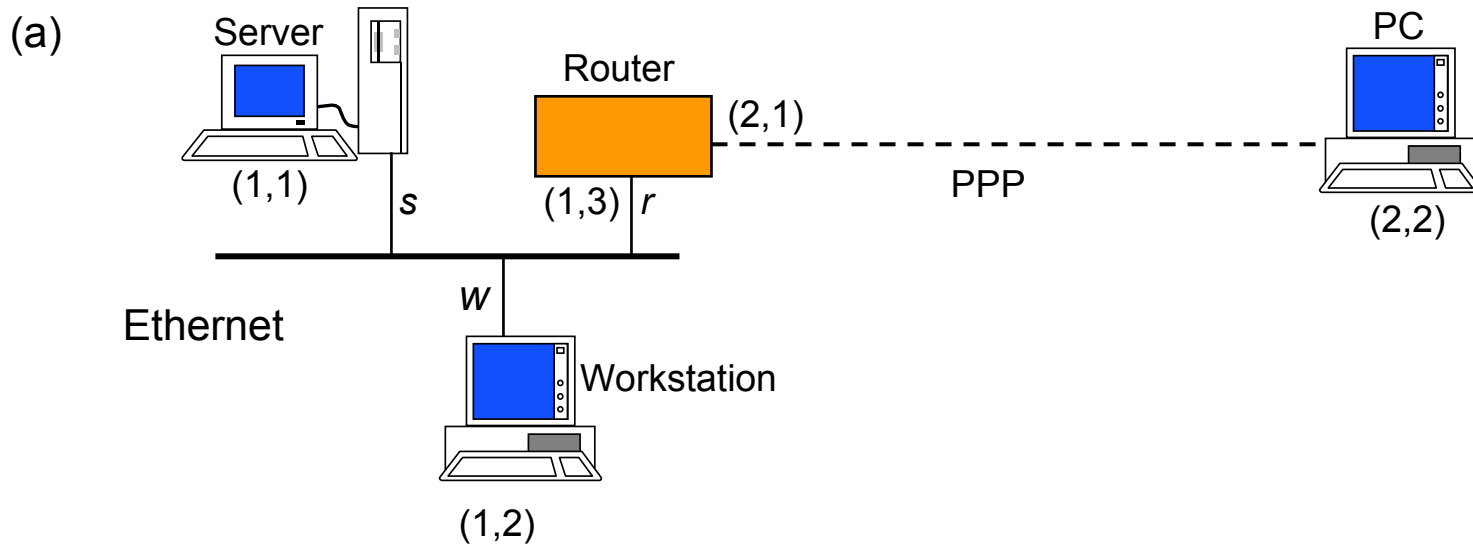

(a)

(b)

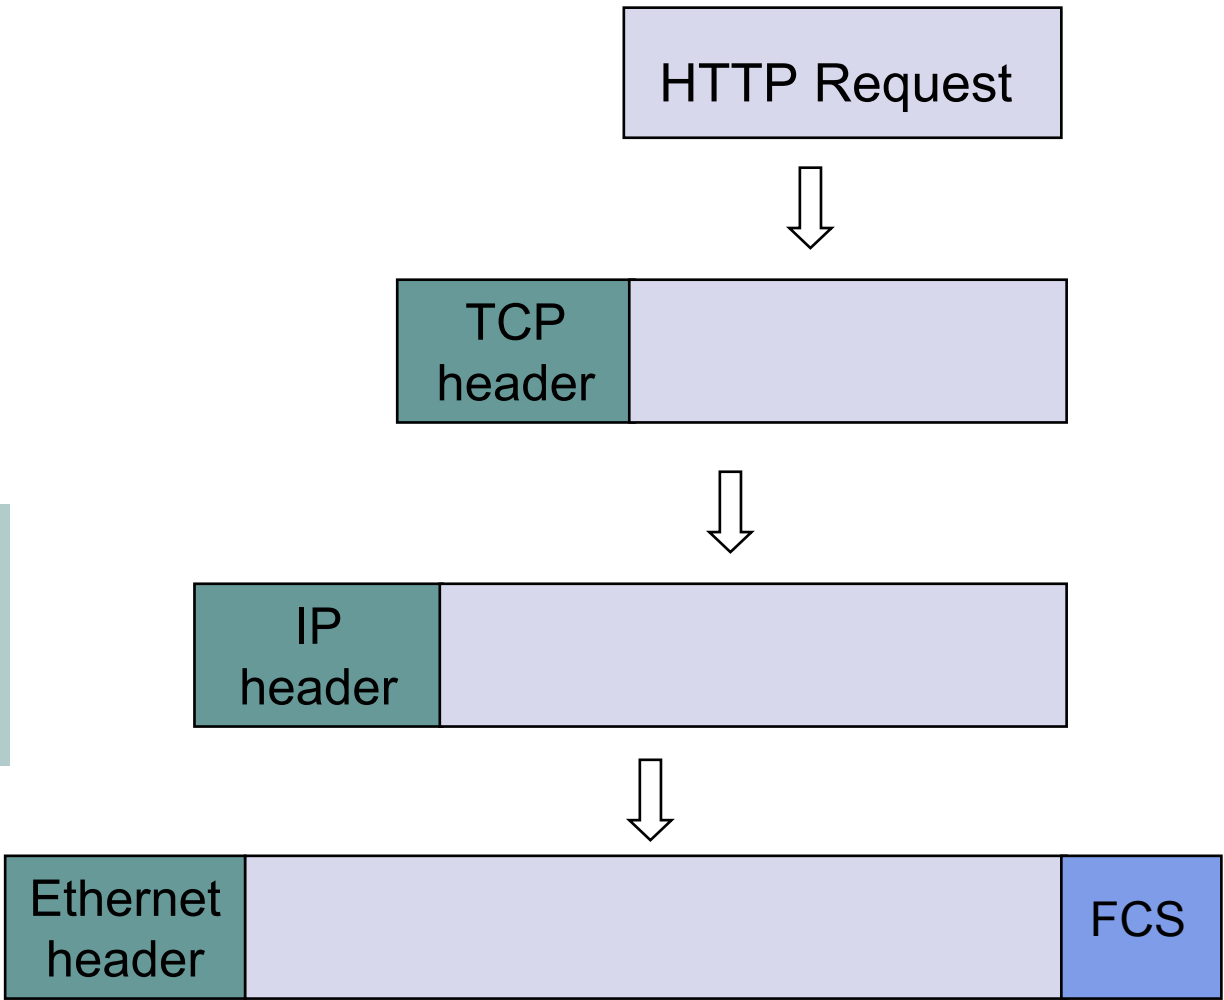

Header contains source and destination physical addresses; network protocol type

Header contains source & destination port numbers

Header contains source and destination IP addresses; transport protocol type

Header contains source & destination physical addresses; network protocol type
