

6. The efficiency of a Carnot engine depends only upon the temperatures of the two heat reservoirs.

$$e_c = (T_H - T_L) / T_H$$

$$e_c = (900 \text{ K} - 300 \text{ K}) / 900 \text{ K} = 0.67$$

or expressed as a percentage

$$e_c = 67\%$$
