

**MASTER ①****PREFACE**

The primary purpose of this text is to present the principles and applications of economic analysis in a clearly written fashion, supported by a large number and wide range of engineering-oriented examples, end-of-chapter exercises, and electronic-based learning options. Through all editions of the book, our objective has been to present the material in the clearest, most concise fashion possible without sacrificing coverage or true understanding on the part of the learner. The sequence of topics and flexibility of chapter selection used to accommodate different course objectives are described later in the preface.

**EDUCATION LEVEL AND USE OF TEXT**

This text is best used in learning and teaching at the university level, and as a reference book for the basic computations of engineering economic analysis. It is well suited for a one-semester or one-quarter undergraduate course in engineering economic analysis, project analysis, or engineering cost analysis. Additionally, because of its behavioral-based structure, it is perfect for individuals who wish to learn the material for the first time completely on their own, and for individuals who simply want to review. Students should be at least at the sophomore level, and preferably of junior standing, so that they can better appreciate the engineering context of the problems. A background in calculus is not necessary to understand the calculations, but a basic familiarization with engineering terminology makes the material more meaningful and therefore easier and more enjoyable to learn. Nevertheless, the building-block approach used in the text's design allows a practitioner unacquainted with economics and engineering principles to use the text to learn, understand, and correctly apply the principles and techniques for effective decision making.

**NEW TO THIS EDITION**

The basic design and structure of previous editions have been retained for the sixth edition. However, considerable changes have been made. The most significant changes include these:

- More than 80% of the end-of-chapter problems are new or revised for this edition.
- Time-based materials such as tax rates and cost indexes have been updated.
- The international dimension of the book is more apparent.
- The Fundamentals of Engineering (FE) Review Problems are new to this edition.

**STRUCTURE OF TEXT AND OPTIONS FOR PROGRESSION THROUGH THE CHAPTERS**

The text is written in a modular form, providing for topic integration in a variety of ways that serve different course purposes, structures, and time limitations.

There are a total of 19 chapters in four levels. As indicated in the flowchart on the next page, some of the chapters have to be covered in sequential order; however, the modular design allows for great flexibility in the selection and sequencing of topics. The chapter progression graphic (which follows the flowchart) shows some of the options for introducing chapters earlier than their numerical order. For example, if the course is designed to emphasize after-tax analysis early in the semester or quarter, Chapter 16 and the initial sections of Chapter 17 may be introduced at any point after Chapter 6 without loss of foundation preparation. There are clear primary and alternate entry points for the major categories of inflation, estimation, taxes, and risk. Alternative entries are indicated by a dashed arrow on the graphic.

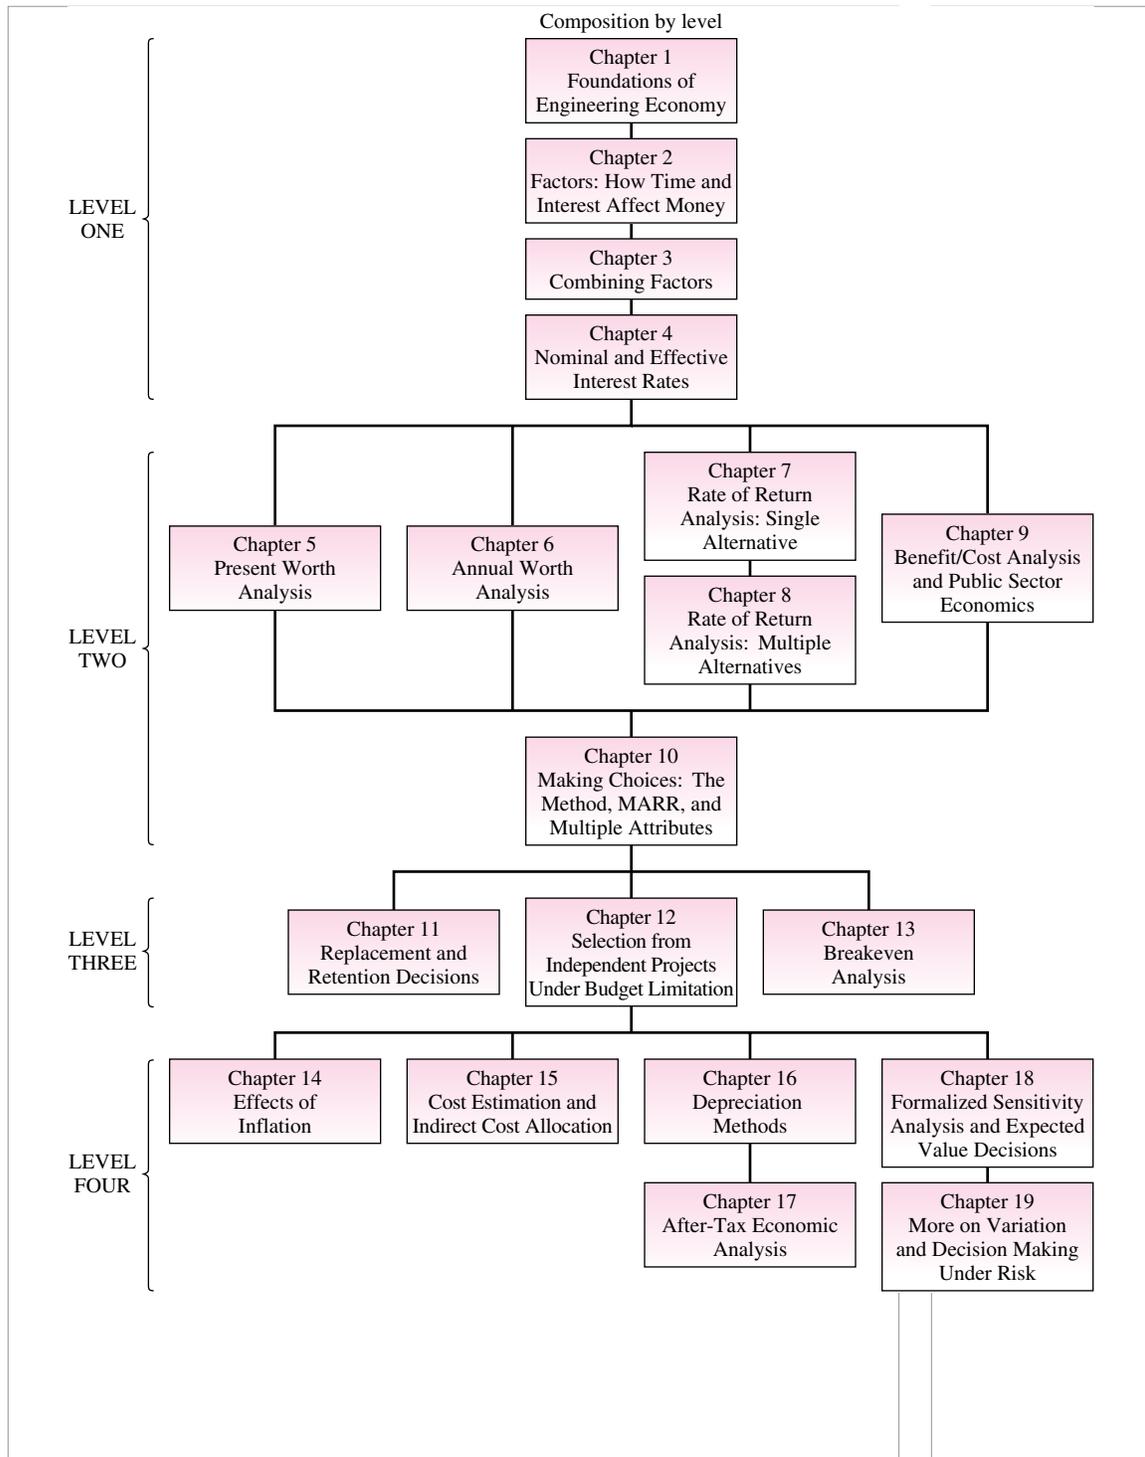

The material in Level One emphasizes basic computational skills, so these chapters are prerequisites for all the others in the book. The chapters in Level Two are primarily devoted to the most common analytical techniques for comparing alternatives. While it is advisable to cover all the chapters in this level, only the first two (Chapters 5 and 6) are widely used throughout the remainder of the text. The three chapters of Level Three show how any of the techniques in Level Two can be used to evaluate presently owned assets or independent alternatives, while the chapters in Level Four emphasize the tax consequences of decision making and some additional concepts in cost estimation, activity-based costing, sensitivity analysis, and risk, as treated using Monte Carlo simulation.

**Organization of Chapters and End-of-Chapter Exercises** Each chapter contains a purpose and a series of progressive learning objectives, followed by the study material. Section headings correspond to each learning objective; for example, Section 5.1 contains the material pertaining to the first objective of the chapter. Each section contains one or more illustrative examples solved by hand, or by both hand and computer methods. Examples are separated from the textual material and include comments about the solution and pertinent connections to other topics in the book. The crisp end-of-chapter summaries neatly tie together the concepts and major topics covered to reinforce the learner's understanding prior to engaging in the end-of chapter exercises.

The end-of-chapter unsolved problems are grouped and labeled in the same general order as the sections in the chapter. This approach provides an opportunity to apply material on a section-by-section basis or to schedule problem solving when the chapter is completed.

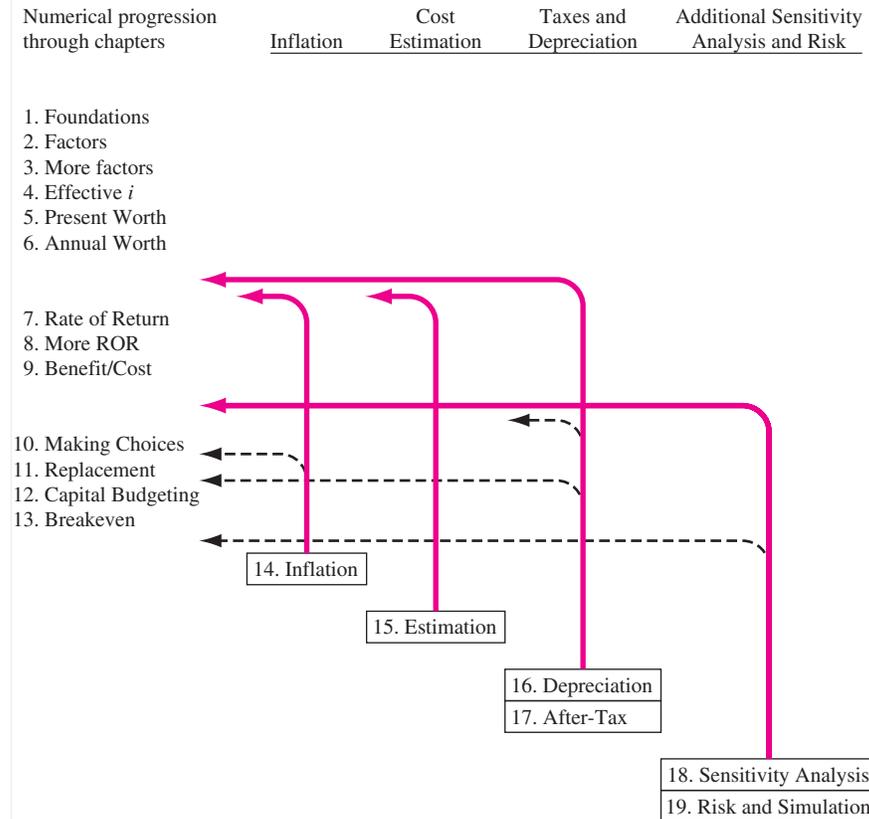

Appendices A and B contain supplementary information: a basic introduction to the use of spreadsheets (Microsoft Excel) for readers unfamiliar with them and the basics of accounting and business reports. Interest factor tables are located at the end of the text for easy access. Finally, the inside front covers offer a quick reference to factor notation, formulas, and cash flow diagrams, plus a guide to the format for commonly used spreadsheet functions. A glossary of common terms and symbols used in engineering economy appears inside the back cover.

# MASTER 1

**OPTIONS FOR PROGRESSION THROUGH CHAPTERS**

Topics may be introduced at the point indicated or any point thereafter  
(Alternative entry points are indicated by ←---)

**APPRECIATION TO CONTRIBUTORS**

Throughout this and previous editions, many individuals at universities, in industry, and in private practice have helped in the development of this text. We thank all of them for their contributions and the privilege to work with them. Some of these individuals are

- Robyn Adams, 12<sup>th</sup> Man Foundation, Texas A&M University
- Jeffrey Adler, MindBox, Inc., and formerly of Rensselaer Polytechnic Institute
- Richard H. Bernhard, North Carolina State University
- Stanley F. Bullington, Mississippi State University
- Peter Chan, CSA Engineering, Inc.
- Ronald T. Cutwright, Florida A&M University

We would also like to thank Jack Beltran for his accuracy check of this and previous editions. His work will help make this text a success.

Finally, we welcome any comments or suggestions you may have to help improve the textbook or the Online Learning Center. You can reach us at l-blank@tamu.edu or lblank@aus.ac.ae and atarquin@utep.edu. We look forward to hearing from you.
