

1	Only a few decades ago a typical hospital was staffed	11
2	by a handful of doctors, about the same number of nurses,	23
3	and a small number of dedicated support staff. Almost all	34
4	of the efforts were directed toward the care of surgery	46
5	patients and the ill. The amazing contrast shown by some	57
6	of our huge new teaching and research hospitals is almost	69
7	impossible to believe. These elite health centers provide	81
8	training for doctors and do the research needed to find	92
9	cures, while giving help to those who can least afford it.	104
10	In addition to the usual expenses of small hospitals,	115
11	there are salaries and support services for interns and	126
12	residents. The staff doctors must not only care for their	138
13	patients; they also devote many hours of their work week in	150
14	preparation and instruction of these interns and residents.	162
15	The gigantic costs for modern research labs that are on the	174
16	cutting edge of finding cures is apparent, and there is no	185
17	doubt that costs for animal labs are apt to be quite huge.	197
18	Teaching hospitals across the country have found that	208
19	they have to join with other agencies to generate the kinds	220
20	of funds required for the budgets that may approach or even	232
21	exceed a billion dollars a year. There are the usual forms	244
22	of payments from patients and health insurance firms, and	256
23	there likely are tuition payments from various types of	267
24	students. However, other sources of funds must be found.	279
25	For this reason, skilled persons are hired to secure grants	291
26	from various private and government agencies.	300
