### 4.4 AVOIDING PIXELATION

DIRECTIONS: Follow the appropriate steps using Adobe Photoshop, or a similar image-editing program, to make the calculations below.

## Maximum size

Online $\qquad$ " (W) x $\qquad$ (H) at 72PPI

Newspaper $\qquad$ " (W) x $\qquad$ (H) at 170 PPI

Magazine $\qquad$ " (W) x $\qquad$ (H) @ 300PPI

## Optimum size

Online $\quad{ }^{\prime \prime}(\mathrm{W}) \times 3.5^{\prime \prime}(\mathrm{H})$ at $72 \mathrm{PPI}=\ldots \quad \mathrm{MB}$
Newspaper $\qquad$ " $(\mathrm{W}) \times 3.5 "(\mathrm{H})$ at $170 \mathrm{PPI}=$ $\qquad$ MB

Magazine $\qquad$ " $(\mathrm{W}) \times 3.5 "(\mathrm{H}) @ 300 \mathrm{PPI}=$ $\qquad$ MB

1 Create a new file in Adobe Photoshop that is 32.444 inches by 48.662 at 72 pixels/inch and in RGB mode. This simulates a photo taken with a digital camera. Note that this file is 23.4 megabytes.

2
What is the largest size this specific photo can be reproduced in the publications indicated without a loss of quality?

3 Your designer indicates that 3 the photo will actually be reproduced only 3.5 inches tall in the newspaper. Using Photoshop's Image Size dialog box, calculate the final width of the image and then the final image size in megabytes.

- To calculate the actual resolution in pixels per inch required by your publication, ask your press operators what "line screen" they use.
- Newspapers typically use a line screen of somewhere between 65 lines per inch and 85 LPI.
- Magazines use 150 LPI.
- To calculate the required resolution, multiply the line screen by two.

> Newspapers $\bullet 65-85 \mathrm{LPI} \times 2=130-170 \mathrm{PPI}$
> Magazines $\cdot 150 \mathrm{LPI} \times 2=300 \mathrm{PPI}$
