

Foreword	v	INTRODUCTION The nature of biology and science	1
Editors	vi	Biology today	2
Contributing authors	vii	Unifying themes in biology	2
Reviewers and Acknowledgments	viii	Living organisms are made of cells	2
E-student	xxiv	DNA is the basis of life	3
E-instructor	xxvi	Life evolves	3
Instructive Art Program	xxviii	Evolutionary relationships are summarised in classifications	4
The Learning System	xxx	The practice of science	5
Case Guide	xxxii	Scientific method	5
An Australian Focus	xxxiv	Making observations	5
New to this edition	xxxv	Testing hypotheses by experiments	5
		Experimental design	5
		Scientific publication	6
		Ethics and social responsibility in science	6

PART 1 Cell biology and energetics

11

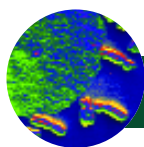

CHAPTER 1 Molecules of life	12	Lipids	32
All life is composed of the same few elements	13	Simple lipids	32
Elements are made of atoms	14	Biomembranes are formed from phospholipids and glycolipids	34
Electrons are in orbit around a nucleus	14	Polyisoprenoid lipids	34
Chemical bonding of atoms makes molecules	15	Proteins	36
Covalent bonds are created by sharing electrons between two atoms	16	Structure and shape of proteins	38
Non-covalent bonds between atoms or molecules	17	Nucleic acids	43
Water is the medium of life	18	Nucleotides	43
Water as a solvent	19	DNA and RNA	43
Hydrophobic interactions	19	CHAPTER 2 The chemistry of life	48
Acids, bases and buffers	22	Chemical reactions and life processes depend on energy	49
pH	22	Energy and entropy	49
Buffers	23	Laws of thermodynamics	50
Biomolecules	23	The equilibrium state of a reaction determines its available energy	50
Carbohydrates	24	Free energy and the equilibrium constant	50
Monosaccharides	26	Spontaneous chemical reactions and free energy	51
Disaccharides	26	Rates of chemical reactions, activation energy and catalysis	52
Polysaccharides	27		

Contents

Enzymes are biological catalysts	53	Osmosis and cells	99
Models of enzyme action	55	Transport of large molecules across membranes	101
Factors affecting enzyme activity	56	Endocytosis	101
Cofactors and coenzymes	57	Exocytosis	102
Chemical reactions drive events in cells	58		
Metabolism	58	<hr/>	
ATP as an energy carrier	58	CHAPTER 5 Harvesting energy	106
Major classes of enzymes	59	Harvesting chemical energy	107
Electron transport pathways	61	Glycolysis: the initial processing of glucose	109
Oxidation and reduction reactions	61	β -Oxidation: the initial processing of lipids	109
Biological electron carriers	62	The citric acid cycle: completing the oxidation of fuels	110
Energy in fuel molecules	63	Recycling electron carriers	111
		The electron transport system: generating ATP	111
		Fermentation: ATP production without oxygen	112
<hr/>		Harvesting light energy: photosynthesis	114
CHAPTER 3 Functioning cells	67	Light energy	115
Eukaryotic cells	69	Pigments: molecules that absorb light	116
Membranes: boundaries and barriers	69	Light-dependent reactions of photosynthesis	117
The nucleus	70	Chloroplasts trap photons	117
Ribosomes	76	Photosystems I and II	117
Endomembrane system	76	Photosynthetic prokaryotes	119
Endoplasmic reticulum	76	Light-independent reactions of photosynthesis	120
The Golgi apparatus	78	Carbon fixation and the Calvin–Benson cycle	120
Intracellular sorting and transport	78	Photorespiration: competition between carbon dioxide and oxygen	122
Mitochondria	79	The C ₄ pathway of photosynthesis	122
Plastids	80	Crassulacean acid metabolism	124
Microbodies	82		
The cytoskeleton	83	<hr/>	
Motility: cilia and flagella	86	CHAPTER 6 Cells, tissues and signals	129
Comparison of prokaryotic and eukaryotic cells	88	Animal tissues	130
		The extracellular matrix	130
		Intercellular connections	131
		Tight junctions	132
		Anchoring junctions	133
		Communicating (gap) junctions	134
		Principal animal tissues	135
		Epithelia	135
		Connective tissue	137
		Muscle	138
		Nervous tissue	138
		Plant cells: the importance of the cell wall	139
		Cell wall structure	140
		Development of plant cell walls	140
		Plasmodesmata: links between plant cells	141
		Plant tissue systems	142
		Dermal tissue	142
		Ground tissue	142
		Vascular tissue	142

Cell signals	143	Nuclear division and cell division	159
Types of signals	144	The cell cycle: an outline	159
Responses to signals	144	Mitosis	161
Chemical stimuli	144	Mitosis in animal cells	161
Physical stimuli	145	Cytokinesis in animal cells	164
Signal processing	149	Mitosis and cytokinesis in plant cells	164
Direct receptor-mediated responses	149	The control of cell division in eukaryotes	166
G-protein-linked receptors	149	Control of cell cycle progression	166
Receptor tyrosine kinases	152	Cyclin–Cdk kinases regulate cell cycle progression	166
		Checkpoint control of the cell cycle	167
<hr/>		Meiosis and the formation of haploid cells	167
CHAPTER 7 Cell division	157	Meiosis I	160
The cell cycle	158	Prophase I	168
Mitosis and meiosis	158	Meiosis II	171
Cell division in prokaryotes	158	Genetic consequences of meiosis	171
The cell cycle in eukaryotes	159		

PART 2 Genetics and molecular biology

175

CHAPTER 8 Inheritance	176	Penetrance and expressivity	195
Genetics: the science of biological information	177	Epistasis	196
The foundation for understanding genetics	177	Epigenetic regulation	196
Inheritance of a single gene	178	X chromosome inactivation	196
Mendel's experiments	178	Imprinting	197
Monohybrid cross	178	Quantitative characters	198
Multiple effects of single genes	181	Understanding genetics as the study of biological information	199
Codominance and blood groups	181		
Inheritance of combinations of genes	183	<hr/>	
Dihybrid cross	183	CHAPTER 9 Genes, chromosomes and DNA	204
Backcrosses and testcrosses	184	Tracking the genetic material	205
Mendelian inheritance in humans	184	Chromosome behaviour accounts for patterns of inheritance	205
The limits of Mendel's ideas	184	Chromosome structure	205
Sex linkage and chromosomes	186	Chromosomes consist of protein and DNA and are assembled into nucleosomes	206
Sex-linked genes	186	Genetic information is stored in DNA and not protein	207
Genes are on chromosomes	187	The structure of DNA explains its capacity to store biological information	208
X-linked traits in humans	189	DNA synthesis: an overview	210
Y-linkage and male sex determination	189	DNA replication in prokaryotes	211
Linkage on autosomes	190	Replication in eukaryotes	214
Linkage and recombination	190		
Chromosome mapping	192	<hr/>	
More variations on Mendel's observations	193	CHAPTER 10 The genetic code	219
Incomplete dominance	193	The one gene–one polypeptide hypothesis	220
Novel phenotypes through recombination	193	The one gene–one enzyme hypothesis	220
Phenotypes and environment	194	The one gene–one polypeptide hypothesis	220

PART 3 Plant form and function

297

CHAPTER 14 Reproduction, growth and development of flowering plants

Plant life cycles	298
Gametes of plants are not the direct result of meiosis	299
Plants have homosporous or heterosporous life cycles	300
The flower: the site of sexual reproduction	300
The anther: the male reproductive organ	301
The carpel: the female reproductive organ	301
Fertilisation	306
Reproduction without fertilisation: the unusual case of apomixis	307
Pollination in flowering plants: choose your partner carefully!	308
The stigma and style recognise pollen	308
Cross-pollination	308
Self-incompatibility is a genetically controlled recognition system	309
Self-pollination	310
Major events in the formation of seeds	311
Development of the embryonic plant	311
Endosperm formation	312
Seed and fruit development	312
Seed maturation, dormancy and germination	312
Organogenesis: making leaves, roots and flowers	314
The shoot apex	314
The root apex	315
Asexual reproduction in flowering plants	315
Vegetative reproduction	315
Totipotency: generating a whole plant from one cell	318
Biotechnology and plants	320
Tissue culture	320
Genetic engineering of plants	320

CHAPTER 15 Structure of plants

Plant cell walls	326
Middle lamella	326
Primary wall	327
Secondary wall	328
Plant tissue systems	328
Dermal tissue	328
Ground tissue	328
Vascular tissue	330
Stem structure	332
Primary growth	332

Secondary growth	334
Special functions of stems	336
Root structure	337
Primary growth	338
Secondary growth	341
Special functions of roots	342
Root adaptations and nutrient supply	343
Leaf structure	345
Leaf arrangement and life span	345
Leaf shape and orientation	345
Leaf structure and organisation	346
Modifications of leaf structure	348

CHAPTER 16 Plant nutrition, transport and adaptation to stress

Nutrition of plants	355
Essential minerals	355
Pathways and mechanisms of transport	358
Water transport	359
Factors that affect water potential	359
Water uptake by plant cells	360
Transpiration	361
Water movement in xylem	362
Water movement from leaves	363
Translocation of assimilates	366
Pathway of assimilate transport	366
What substances are transported in phloem?	367
Rate of phloem transport	368
Mass-flow mechanism of transport	368
Adaptations to stress	369
Water stress	370
Salinity and mineral stress	373
Lack of oxygen around roots	374
Temperature stress	374

CHAPTER 17 Plant hormones and growth responses

Auxin	380
Auxin and phototropism	380
Indole-3-acetic acid and other auxins	381
Auxin and cell elongation	382
Auxin and apical dominance	383

Contents

Gravitropism	383	Seed dormancy	389
Auxin binding proteins	384	Ethylene	390
Gibberellins	384	Signal transduction	390
Gibberellins and stem elongation	384	Fruit ripening	391
Gibberellins and mobilisation of seed protein and carbohydrate reserves	385	Shoot growth and flowering	391
Cytokinins	386	Brassinosteroids	392
Abscisic acid	388	Photoperiodism and control of flowering	393
ABA and drought resistance	388	Short-day and long-day plants	393
ABA and frost tolerance	389	Vernalisation and flowering	396
		Monocarpic senescence	396

PART 4 Animal form and function

399

CHAPTER 18 Animal reproduction	400	Regulation of development: cytoplasmic determinants and cell signalling	438
Asexual reproduction	401	Primary induction and mesoderm induction in amphibia	439
Regeneration	401	The notochord and neural tube development	442
Budding	401	Genetic regulation of development	442
Parthenogenesis	402	Genomic equivalence	442
Sexual reproduction	402	Pattern formation	443
Hermaphroditism	403	Mutation is a powerful means of identifying developmental patterning genes	444
Reproductive strategies	405	Mutations that change the pattern of body structures	444
The costs of sexual reproduction	406	The molecular genetics of segmentation in <i>Drosophila</i>	444
Gametogenesis and fertilisation	410	Early embryonic development in <i>Drosophila</i>	444
The formation of gametes: gametogenesis	411	Specifying the anterior–posterior axis	445
Fertilisation: cellular events	416	Zygotic segmentation genes	447
		Homeotic (Hox) genes	448
		Genetic regulation and intercellular signalling control development	450
CHAPTER 19 Animal development	423	CHAPTER 20 Animal and human nutrition	454
Features of animal development	424	What nutrients do animals need?	455
Cell behaviour during development	424	Nutrient composition of foods	458
Anterior–posterior and dorsal–ventral axes	424	Plant tissues	458
Embryonic development	424	Animal tissues	459
Cleavage	424	How much food do animals require?	460
Gastrulation	427	Metabolic rate and body mass	460
Mechanisms of morphogenesis	431	The digestive process	461
Organogenesis	433	Physical digestion	461
Neurulation	433	Enzymatic digestion	461
Limb formation	435	Control of digestive secretion in humans	461
Cell lineages and the maintenance of animal tissues	436	Evolution and diversity of digestive systems	465
Cell lineages	436	Intracellular and extracellular digestion	465
Stem cells	436	Simple digestive cavities	465
Tissue maintenance	437	Two openings: one-way movement of food	466
Blood cell formation	437		

Muscular gut wall: coelomates	466	Blood	531
Chitinous mouthparts: arthropods	467	Erythrocytes	532
Jaws and teeth: vertebrates	468	Blood clotting	532
Mammals	469		
Filter feeding: eating tiny particles	470		
Dealing with plant cell walls	471	<hr/>	
Digesting cellulose	473	CHAPTER 23 Water, solutes and excretion	537
Foregut fermentation	473	Water and solutes	538
Ruminant foregut fermenters	474	Exchange with the environment	538
Hindgut fermentation	475	Extracellular and intracellular environments	539
Body weight regulation in humans	476	Patterns of ionic and osmotic balance	540
Body composition and the myth of fast and slow metabolism	476	Living in sea water	540
Where does our body fat come from?	476	Living in salt lakes	542
Fuel for our bodies to meet our energy needs	477	Living in fresh water	542
Mechanisms for regulating body fat: evidence for a genetic basis of body mass	477	Moving between sea and fresh water	543
		Living on land	544
		Nitrogenous wastes	545
		Phylogenetic and environmental patterns	546
		Excretion	547
		Epithelial excretory organs	547
		Tubular excretory organs	548
		Invertebrates	549
		Vertebrates	551
<hr/>		<hr/>	
CHAPTER 21 Gas exchange in animals	482	CHAPTER 24 Innate defences and the immune system	561
Air and water as respiratory media	483	Innate defence mechanisms	563
Exchanging gases	484	External barriers	563
Surface area and volume	486	Identifying an invader	563
Ventilation and convection	486	Cells that kill	564
Gas-exchange organs	487	Defensive molecules	565
Water breathers	487	The inflammatory response	566
The transition from water to air breathing	491	Specific acquired immunity	566
Air breathing: lungs	493	Cells of the immune system	569
Air breathing: tracheae	499	Lymphocytes and specificity	569
Transporting gases	502	T lymphocytes (T cells) and the thymus	571
Transport of oxygen	502	B lymphocytes (B cells) and their development	572
Oxygen-carrying capacity	503	Phagocytic cells	573
Oxygen affinity	503	Dendritic cells	573
Transport of carbon dioxide	504	NK cells	573
Control of ventilation	505	Molecules of the immune system	573
		Antigens	573
		Antibodies (immunoglobulins)	575
		The T-cell receptor (TCR)	575
		The major histocompatibility complex (MHC)	576
		The problems of tolerance and autoimmunity	578
<hr/>			
CHAPTER 22 Circulation	509		
Open and closed circulatory systems	510		
Circulatory systems of vertebrates	511		
How the heart works	516		
Electrical activity	518		
The electrocardiogram	519		
Structure and function of blood vessels	519		
The microcirculation	521		
Capillary exchange	522		
The lymphatics	525		
Regulation of blood flow and pressure	525		
Cardiovascular regulation in vertebrates	526		
Regulation of blood flow to tissues	529		

Nature of immune responses	578		
Secondary lymphoid tissues and the lymphatic network	578		
Humoral responses	580		
Cellular responses	581		
Immunity to infection	581		
Defence against tumours	584		
Allergy, hypersensitivity and immunopathology	585		
Evolution of immune responses	586		
Immunity in animals	586		
Immunity in plants	587		
<hr/>			
CHAPTER 25 Hormonal control in animals	592		
Animal hormones	593		
Sites of action	594		
General functions	595		
Mechanisms of hormone action	595		
Hormone control systems	596		
Neurosecretion	596		
Non-neural hormone secretion	596		
Hormones in invertebrates	599		
Hormonal control of development	599		
Other invertebrate hormones	600		
Hormones in vertebrates	600		
Neurohaemal organs	600		
Non-neural endocrine glands	604		
<hr/>			
CHAPTER 26 Nervous systems	615		
Neurons: the functional units of nervous systems	616		
What types of neurons are there?	617		
Neurons transfer information as electrical signals	619		
The active responses of neuronal membranes	619		
What are action potentials?	621		
How are action potentials conducted?	621		
How is electrical information transmitted to other cells?	622		
What are synaptic potentials?	622		
How do neurons integrate information?	624		
The evolution of nervous systems	626		
Complex nervous systems: vertebrates	627		
The mammalian brain	627		
Higher functions of brains	630		
How do neural circuits produce behaviour?	631		
The functional divisions of nervous systems	632		
Controlling muscles and movements	632		
Monitoring the external world	634		
Visceral control	639		
<hr/>			
CHAPTER 27 Animal movement	643		
Locomotion as a key to animal life	644		
Living in water	644		
Buoyancy	644		
Non-muscular locomotion	645		
Muscular locomotion	646		
Travelling through air	649		
Unpowered (gliding) flight	649		
Powered flight	652		
Moving on land	653		
Locomotion without legs	653		
Locomotion with legs	654		
Muscles and skeletons working together	657		
Skeletons	657		
Joints	660		
Size and the skeleton	662		
Muscle	662		
<hr/>			
CHAPTER 28 Animal behaviour	671		
Genetics and the evolution of behaviour	672		
Genetic markers	673		
Selection experiments	673		
Populations with genetic differences	673		
Learning and the development of behaviour	673		
Understanding complex behaviour	675		
Obtaining food	676		
Avoiding being eaten	677		
Living in groups	678		
Competition and territorial behaviour	679		
Territorial behaviour	679		
Animal contests	680		
Courtship and mating behaviour	681		
Courtship	681		
Parental care	685		
Social organisation and co-operative behaviour	686		
Co-operative breeding in birds and mammals	687		
Insect societies	688		
Evolution of co-operation	689		
<hr/>			
CHAPTER 29 Animals responding to environmental stress	693		
Phenotypic plasticity	694		
Animals in the Australian arid zone	694		
Termites in arid Australia	695		

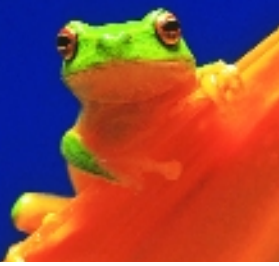

Animals living at low temperatures	696	Torpor in mammals and birds	701
Do animals freeze?	696	Environmental oxygen stress	702
Insects at low temperatures	696	Adaptations to low levels of oxygen	704
The Q10 concept	697	Responses to high altitude in humans	706
Temperature regulation and metabolism in animals	697	Other animals at high altitude	708
Thermal acclimation	699	Oxygen stress and temperature	708
Metabolic depression in animals	700	Responses of animals to global warming	709
Hypothermia and the concept of torpor	700		

PART 5 Evolution and biodiversity

713

CHAPTER 30 Evolving life	714	CHAPTER 32 Mechanisms of evolution	755
Recording the diversity of life	715	Key concepts in evolution	756
Discovering phylogeny and the evolutionary tree of life	715	A population	756
How to discover a phylogenetic tree by cladistic analysis	715	The gene pool	756
Comparing morphology	717	A species	756
Homologous features are evidence of relationships between divergent forms	718	Evolutionary change	756
Analogous features are evidence of convergence	718	Variation	757
Comparing molecules	720	Evolution by means of natural selection	757
Comparing amino acid sequences of proteins	720	The neo-Darwinian theory of evolution	758
Comparing nucleotide sequences of DNA	720	Macroevolution	758
Classification is based on phylogenetic relationships	724	Evolutionary trees	758
Purposes of classification	724	Speciation	758
Taxonomy and naming the hierarchy of life	724	Genetic variation arises by mutation	760
The binomial system	727	Effect of mutation	760
Species are the basic taxonomic units	728	Genes in populations	761
Kingdoms of life	729	Detecting and measuring genetic variation in populations	761
		The Hardy-Weinberg principle	762
		Factors that change the genetic structure of populations	763
CHAPTER 31 Evolving earth	734	Random mating	763
Fossils are a record in rocks of past life	735	Mutation	763
How do fossils form and where are they found?	735	Migration	763
Dating rocks provides a time scale of evolution	736	Genetic drift	763
Evolving earth influences life	739	Natural selection	763
Plate tectonics explains how continents drift	739	Examples of natural selection	767
Ancient positions of continents	740	Theories of speciation	770
Geological eras mark major events in evolution	741	Species' concepts	770
Precambrian life	741	Reproductive isolation and speciation	771
Ediacaran fauna—evidence of multicellular organisms	741	Modes of speciation	773
Palaeozoic life: ancient life	743	Speciation and chromosomal rearrangement	775
Mesozoic life: age of dinosaurs	746	Hybridisation and asexual reproduction	775
Cenozoic life: the beginning of modern life	748		
Biogeographic regions of the modern earth reflect evolutionary history	749		

Contents

Molecular evolution	777		
Gene duplication	777		
Homologous genes	777		
Constructing evolutionary trees from molecular data	778		
A challenge for the future	778		
<hr/>			
CHAPTER 33 Bacteria	782		
Bacteria are prokaryotes	783		
Bacteria were the first cellular life on earth	785		
Early photosynthetic bacteria	785		
Two major evolutionary lineages of bacteria—super kingdoms			
Bacteria and Archaea	786		
Classifying and identifying bacteria	787		
Super kingdom Bacteria includes cyanobacteria and endospore-forming species	788		
Super kingdom Archaea includes halophiles, acidophiles, thermophiles and methanogens	792		
The remarkable abundance and metabolic diversity of bacteria	793		
Bacterial populations are often very large and dense	793		
The metabolic diversity of bacteria	793		
Four nutritional types of bacteria—chemoheterotrophs, photoautotrophs, chemoautotrophs and photoheterotrophs	796		
Genetic systems of bacteria	799		
Transformation: gene transfer by free molecules of DNA	800		
Conjugation: gene transfer by plasmids	800		
Transduction: gene transfer by bacteriophages	800		
The importance of plasmids and phages to bacterial populations	802		
<hr/>			
CHAPTER 34 Viruses	806		
The discovery of viruses	807		
Viruses are subcellular organisms	809		
Features distinguishing viruses from cellular organisms	809		
Virions are the transmission phase	810		
Viral genomes	810		
Replication	812		
Ecology and spread of viruses	814		
Classification and relationships of viruses	815		
Other virus-like ‘agents’	818		
Satellite viruses	818		
Retrotransposons and similar agents	818		
Viroids and prions: virus-like infectious agents	818		
Virus control	819		
<hr/>			
CHAPTER 35 The protists	822		
Protists are a diverse group of eukaryotes	824		
Where did eukaryotic cells come from?	824		
Origin of the nucleus	824		
The endomembrane system: extension of the nuclear envelope	824		
Mitochondria and plastids arose by endosymbiosis	825		
Cilia and flagella: extensions of the cytoskeleton	826		
Are simple protists ancient eukaryotes?	826		
Sponge-like protists	827		
‘Collar’ flagellates: choanoflagellates	827		
Slime moulds	827		
Cellular slime moulds	827		
Acellular slime moulds: myxomycetes	830		
Parasitic flagellates that contaminate water supplies: diplomonads	831		
Symbionts and parasites: parabasalids	831		
Amoebae	832		
Rhizopods are amoebae that can alter their shape	832		
Actinopods are radially symmetrical unicells	832		
Protists with plastids	833		
Protists with primary plastids: the ‘green lineage’	833		
Missing links in endosymbiosis: glaucophytes	834		
Red algae: rhodophytes	834		
Green algae: chlorophytes	835		
Protistan pirates with second-hand plastids	837		
Chromist protists: the ‘brown lineage’	837		
Flagellates with second-hand plastids: cryptomonads	837		
Golden flagellates: chrysophytes	838		
Chalk comes from dead algae: haptophytes	839		
Algae in glass houses: diatoms	840		
Brown algae: phaeophytes	840		
Water moulds and downy mildews: oomycetes	843		
Alveolates: dinoflagellates, ciliates and parasites	844		
Dinoflagellates: whirling algae	844		
Small but deadly: apicomplexans	846		
Ciliates: eukaryotes with two different nuclei	848		
Euglenoids and kinetoplasts	849		
Euglenoid flagellates	849		
Flagellate parasites: kinetoplasts	850		
Cercozoa and forams	851		
Amoebae with second-hand chloroplasts: chlorarachniophytes	851		
More chalky protists: forams	852		

CHAPTER 36 Plants 856

Evolution of plants	857
Green algae and the origin of land plants	858
Adaptations to living on land	859
Specialisation of vegetative features	859
Alternating generations and sexual reproduction	860
Non-vascular plants: liverworts, hornworts and mosses	862
Gametophytes: the haploid generation	862
Sporophytes: the diploid generation	865
Vascular plants evolved conducting tissues	867
Lycophytes: clubmosses and quillworts	868
Psilophytes: fork ferns	870
Sphenophytes: horsetails	870
Filicophytes: ferns	871
Seed plants	874
Seeds from ovules	874
Pollen transport of male gametes	875
Secondary growth allows plants to become large	875
Cycadophytes: ancient seed plants	876
Ginkgophytes: retain flagellated sperm	877
Coniferophytes: successful non-flowering seed plants	877
Gnetophytes: closest relatives of flowering plants?	880
Magnoliophytes: flowering plants	881
The flower	883
Origin and evolution of the flower	883
In the life cycle of flowering plants fertilisation is a 'double' event	885
The agents of pollination are often animals	886
Fruits protect seeds and aid their dispersal	888

CHAPTER 37 Fungi 893

The diversity and evolution of fungi	894
What is a fungus?	895
Fungal growth	896
Hyphae are for feeding	896
Specialised hyphae	897
Fungal nuclei are different	898
Fungal nutrition	899
Fungi digest nearly any form of organic carbon	899
Fungi tolerate environmental extremes	900
Fungal reproduction	901
Spores for travel and survival	901
Life without sex	901

Fungal phyla	902
Chytrids: phylum Chytridiomycota	903
Moulds and mycorrhizae: phylum Zygomycota	904
Brewer's yeast to truffles: phylum Ascomycota	905
Smuts to shiitake: phylum Basidiomycota	906
The anamorphs: phylum Deuteromycota	909
Fungal mutualisms	909
Lichens	909
Mycorrhizae	911
Endophytes	912
Fungi and insects	912
Fungi and humans	913
Eating and drinking fungi	913
Poisonous fungi	913
Allergens and fungal diseases	914
Agriculture	915
Biological control	915
Fungi and biotechnology	915

CHAPTER 38 Simple animals: sponges to flatworms 918

Animals are multicellular, heterotrophic organisms	919
What do we know of the origin and early evolution of animals?	919
The origin of multicellularity	919
Fossil faunas and what they tell us about the history of animals	919
The phylogeny of modern groups of animals	920
Protostomes and deuterostomes: two modes of development	921
Sponges: phylum Porifera	921
Radially symmetrical animals	923
Polyps and medusae: phylum Cnidaria	923
Jellyfish: class Scyphozoa	926
Box jellyfish: class Cubozoa	927
Hydras: class Hydrozoa	927
Sea anemones and corals: class Anthozoa	928
Comb jellies: phylum Ctenophora	930
Simple protostomes	931
Flatworms: phylum Platyhelminthes	931
Free-living flatworms: class Turbellaria	932
Ectoparasitic flukes: class Monogenea	933
Endoparasitic flukes: class Trematoda	933
Tapeworms: class Cestoda	935
Proboscis worms: phylum Nemertea	936

Contents

CHAPTER 39 Annelids, molluscs, nematodes and arthropods

Coelomate protostomes	942
Segmented worms: phylum Annelida	942
Functional implications of segmentation and a coelom	943
Marine bristle worms: class Polychaeta	944
Annelids with a clitellum: class Euclitellata	945
Snails, clams and relatives: phylum Mollusca	947
Molluscan body plan	947
Chitons: class Polyplacophora	948
Filter feeding and the class Bivalvia	949
Torsion and the class Gastropoda	950
Squid and octopus: class Cephalopoda	952
Roundworms: phylum Nematoda	954
Joint-limbed animals with an exoskeleton: phylum Arthropoda	956
Evolution of arthropods	956
Advantages and disadvantages of an exoskeleton	957
Features of the arthropod body	957
Chelicerate arthropods: spiders, scorpions and their relatives	957
Mandibulate arthropods: myriapods, crustaceans and insects	959

CHAPTER 40 Echinoderms and chordates

Echinoderms	969
The echinoderm skeleton	969
The water vascular system	970

Reproduction, development and regeneration	971
Echinoderms include six classes of marine animals with five-rayed symmetry	972

Chordates

Acorn worms and pterobranchs: hemichordates	974
Tunicates: urochordates	975
Lancelets: cephalochordates	975

Craniates: chordates that evolved a head

Jawless craniates: lampreys and hagfishes	976
Vertebrates: craniates that evolved a backbone and jaws	976
Cartilaginous fishes	977
Ray-finned fishes	978

Tetrapods and their relatives

Coelacanth and lungfishes	980
Amphibians: living on land and in water	980
Amniotes: an embryo with a pond of its own	981
Turtles and their relatives	982
Snakes, lizards and the tuatara	982
Archosaurs: crocodiles, dinosaurs and birds	982
Mammals	985
Primates	987

Human evolution

Sahelanthropus and Australopithecus: upright apes, the first hominids	990
Paranthropus: robust forms	992
Homo: increase in brain size	992
Out-of-Africa or a multiregional origin of Homo sapiens?	993

PART 6 Ecology

997

CHAPTER 41 Australian biota

The Australian biota: southern connections	999
Australia in Gondwana	1000
Evolution of Australian environments through the Cenozoic	1001
Changing climate and increased aridity	1001
Changing landforms and weathering of soils	1002
Increasing frequency of fire	1003
Quaternary ice ages: cool, arid periods	1003
Arrival of humans	1004
Modern Australian environments	1006
Terrestrial environments	1006

Marine environments	1006
---------------------	------

Australian flora

Dominance of sclerophylls ('hard' leaves)	1009
Succulent survivors	1010
Characteristics of some Australian flowering plants	1011

A unique southern fauna

Insects with southern connections	1017
Biogeographic patterns of terrestrial vertebrates	1017
Adaptive radiation of frogs	1017
Australian reptiles	1018
Adaptive radiation in mammals	1019

CHAPTER 42 Population ecology	1028	CHAPTER 44 Ecosystems	1075
What is a population?	1029	Feeding relationships shape ecosystems	1076
Distribution and abundance of populations	1029	Food chains and food webs	1077
Potential and realised distributions	1031	Ecological pyramids	1080
Density-independent population dynamics	1033	Pyramids of numbers	1080
Exponential population growth in discrete time	1033	Pyramids of biomass	1081
Modelling density-independent growth	1033	Pyramids of energy	1081
Environmental variability and exponential growth	1034	Why food chains are short	1081
Exponential population growth in continuous time	1034	Productivity of different ecosystems	1084
Density-dependent population dynamics	1036	Productivity of ecosystems may change through time	1085
Space-limited populations	1037	Biogeochemical cycles	1086
Age- and size-structured population dynamics	1039	The water cycle	1086
Bioeconomics: managing exploited populations	1041	Carbon cycle	1089
Viable population sizes for conservation	1043	Nitrogen cycle	1091
		Phosphorus cycle	1093
CHAPTER 43 Living in communities	1047	CHAPTER 45 Human impacts	1099
Species coexist and interact in communities	1048	Humans in Australia	1100
Community structure	1048	Changing Australian environments	1102
Species diversity	1048	Losing biodiversity	1102
Structural diversity of plant communities	1049	Biodiversity hotspots	1103
Interactions within communities	1052	Why conserve biodiversity?	1103
Symbiosis	1052	Land clearance and habitat fragmentation	1105
Commensalism	1053	Introducing new species	1106
Mutualism	1053	Impact of weeds	1108
Parasitism	1054	Land and water degradation	1109
Predation	1055	Polluting the atmosphere	1113
Abundance of predators and prey	1055	Towards sustainability	1116
Fruit eaters aid seed dispersal	1056	Illegal trade in endangered species	1116
Predation and biological control	1056	Legislative and policy framework	1117
Plant defences	1057	Managing natural communities for conservation	1117
Animal defences	1058	Restoration ecology: resetting the clock	1118
Keystone predators	1059	Ecologically sustainable development	1118
Competition	1060	Appendix 1 Classification of cellular organisms	1123
Ecological niche	1061	Glossary	1126
Niche overlap and character displacement	1062	Credits	1160
Communities are not constant	1063	Index	1165
Succession: the replacement of one community by another	1063		
Disturbance affects many communities	1064		
Fire promotes habitat variability	1064		
Disturbance can promote diversity	1065		
... but humans can act as novel disturbances	1056		
Communities are the result of many different interactions	1067		
Biomes: communities on a global scale	1069		
Gradients and ecotones	1069
